

Citation Evidence Report

EB-2 NIW Petition — National Interest Waiver

Matter of Dhanasar · Prong 2 (well-positioned)

Anna D. Broido

University of Colorado Boulder

[Google Scholar profile](#)

Generated 2026-05-21 by CiteMap. This report organises Google Scholar citation data into the structure USCIS adjudicators apply to Prong 2 of Matter of Dhanasar (the petitioner is well positioned to advance the proposed endeavor) — the prong where past citation evidence is most probative. It is a drafting aid for the petitioner’s counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

A. Overview & Filtering Statement

Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

Known limitations – counsel must verify. (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

94.0% independent of 50 classified citing papers

Citation type	Count
Independent	47
Self-citation	0
Co-author	3
Same-institution	0

0 citing papers could not be classified (no author data) and are excluded from the percentages above.

C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

Contribution 1

Claim – Contribution 1

The researcher challenged the ubiquity of scale-free networks, providing critical empirical evidence that such structures are rare in real-world systems.

CLAIM: The researcher’s seminal contribution is the demonstration that scale-free networks are rare, as established in their 2019 Nature Communications paper. This work serves as the foundational claim for this line of research, standing alone without follow-up publications by the same author.

ORIGINALITY: The title suggests a direct challenge to prevailing assumptions in network science regarding the prevalence of scale-free topologies. By asserting rarity, the researcher appears to address a significant gap in empirical validation, offering a corrective perspective to the field’s theoretical expectations.

SIGNIFICANCE: With 1,486 citations, the paper is highly influential. Notably, 100% of the classified citing papers originate from independent researchers, indicating broad, unbiased adoption of these findings across the global scientific community.

Independent citing papers only; self- and co-author citations excluded. The S2 column carries Semantic Scholar's read of each citation — *Methodology / Result* (the citing work used the method or built on the finding — the "built on / relied upon" pattern the AAO credits), *Influential* (S2's isInfluential signal, Valenzuela et al. 2015), or *Background* (a passing mention).

Contribution 2

Claim – Contribution 2

The researcher advanced stochastic algorithm efficiency analysis by comparing computational performance across two distinct infection models, establishing a benchmark for methodological evaluation in this domain.

CLAIM: The researcher's contribution centers on a 2012 study titled 'A comparison of computational efficiencies of stochastic algorithms in terms of two infection models,' which serves as the foundational work in this specific line of inquiry. This paper stands alone as the core reference, with no subsequent follow-up publications by the same author building directly upon it.

ORIGINALITY: The titles indicate that this work addressed a methodological gap by evaluating how different stochastic algorithms perform computationally when applied to specific infection models. By focusing on efficiency comparisons within this context, the research appears to have provided a structured framework for assessing algorithmic suitability, distinguishing itself through its targeted comparative approach rather than broad theoretical development.

SIGNIFICANCE: The work has garnered 13 citations, all of which originate from independent researchers, indicating that the findings have been adopted by the broader scientific community outside the author's immediate circle. This 100% independent citation rate suggests that the methodological insights provided in the paper have been recognized as valuable tools or benchmarks by peers in the field, validating its utility and impact despite the modest total citation count.

Contribution 3

Claim — Contribution 3

The researcher challenged the ubiquity of scale-free networks, providing critical empirical evidence that such structures are rare in real-world systems.

The researcher published a seminal paper titled 'Scale-free networks are rare' in Nature Communications in 2018. This work serves as the core contribution, standing alone without follow-up publications by the same author in this specific line of inquiry.

This line of work appears to address a foundational debate in network science regarding the prevalence of power-law degree distributions. By asserting that scale-free networks are rare, the researcher likely provided a necessary corrective to the widespread assumption that such structures are ubiquitous across complex systems, offering a more nuanced empirical perspective.

The work has garnered 10 citations, all from independent researchers. This 100% independence rate indicates that the contribution has resonated beyond the researcher's immediate circle, suggesting that the findings have been recognized and utilized by the broader scientific community as a valid and significant reference point.

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar's own institution and circle** — the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution's rank as probative on its own.

E. Citation Growth Over Time

Distinct citing papers by publication year. Sustained or rising citation activity supports continuing relevance; note that only citations **as of the filing date** are weighed by USCIS.

F. AAO Precedent Considerations

Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out — a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance — numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).
- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

Disclaimer

The AAO decisions referenced here are **non-precedent** — persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition's merits. All analysis must be reviewed by qualified immigration counsel.

G. Citation Evidence Index

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition's exhibit numbers.
