

Citation Evidence Report

EB-2 NIW Petition — National Interest Waiver

Matter of Dhanasar · Prong 2 (well-positioned)

Arthur Taylor Winfree

University of Arizona (in memoriam)

[Google Scholar profile](#)

Generated 2026-05-21 by CiteMap. This report organises Google Scholar citation data into the structure USCIS adjudicators apply to Prong 2 of Matter of Dhanasar (the petitioner is well positioned to advance the proposed endeavor) — the prong where past citation evidence is most probative. It is a drafting aid for the petitioner’s counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

A. Overview & Filtering Statement

39	39	5	53
Citing papers mapped	Citation edges	Home papers mapped	h-index (GS)

Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

Known limitations – counsel must verify. (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

100.0% independent of 39 classified citing papers

Citation type	Count
Independent	39
Self-citation	0
Co-author	0
Same-institution	0

0 citing papers could not be classified (no author data) and are excluded from the percentages above.

C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

Contribution 1

Claim – Contribution 1

The researcher established a foundational geometric framework for modeling biological time, as evidenced by the seminal 1980 paper that has garnered over 6,000 citations.

The researcher’s primary contribution is the development of a geometric approach to understanding biological time, anchored by the 1980 publication titled 'The geometry of biological time.' This work stands as a singular, seminal piece in the researcher’s portfolio, with no subsequent follow-up papers listed to extend or modify the initial framework.

This line of work appears to address the challenge of quantifying temporal dynamics in biological systems through geometric principles. By introducing this specific theoretical lens in 1980, the researcher likely provided a novel mathematical structure for analyzing time-dependent biological processes, distinguishing this approach from prevailing methods of that era.

The significance of this contribution is underscored by its extensive uptake within the scientific community. With 6,271 citations, the paper is highly influential. Furthermore, analysis of 39 citing papers reveals that 100% originate from independent researchers, indicating that the work has been widely adopted and validated by the broader field rather than relying on self-citation or institutional echo chambers.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 9 · 1 flagged influential by Semantic Scholar

CORE PAPER

[The geometry of biological time](#)

1980 · 6,271 citations (GS)

The S2 column carries Semantic Scholar's read of each citation — *Methodology / Result* (the citing work used the method or built on the finding — the “built on / relied upon” pattern the AAO credits), *Influential* (S2's isInfluential signal, Valenzuela et al. 2015), or *Background* (a passing mention).

Contribution 2

Claim – Contribution 2

The researcher established a foundational theoretical framework for understanding how coupled oscillators synchronize, fundamentally advancing the mathematical modeling of biological rhythms and population dynamics.

CLAIM: The researcher's seminal 1967 paper in the Journal of Theoretical Biology appears to have established a core theoretical framework for analyzing the behavior of populations of coupled oscillators in the context of biological rhythms. This work stands as a singular, highly influential contribution without direct follow-up publications by the same author in the provided dataset.

ORIGINALITY: The title suggests the researcher addressed a critical gap in understanding how individual rhythmic units interact to produce collective behavior. By focusing on coupled oscillators, this line of work likely introduced novel mathematical approaches to model synchronization phenomena that were previously difficult to quantify in biological systems.

SIGNIFICANCE: The enduring impact of this contribution is evidenced by its substantial citation count of 2636. Furthermore, the citation analysis reveals that 100% of the classified citing papers originate from independent researchers, indicating that the work has been widely adopted and validated by the broader scientific community rather than relying on self-citation or institutional bias.

Contribution 3

Claim – Contribution 3

The researcher established a foundational framework for understanding spiral waves of chemical activity, a seminal contribution that has profoundly influenced the field of nonlinear dynamics and chemical physics.

The researcher's primary contribution rests on the seminal 1972 paper titled 'Spiral waves of chemical activity.' This work appears to have introduced a critical conceptual or empirical framework for analyzing complex wave patterns in chemical systems, serving as a cornerstone for subsequent theoretical and experimental investigations in the domain.

This line of work addresses the fundamental challenge of characterizing self-organizing patterns in reactive media. By focusing on spiral waves, the researcher likely provided novel insights into the mechanisms driving such nonlinear phenomena, distinguishing this approach from prior linear or simpler models of chemical kinetics. The absence of follow-up papers by the same author suggests the core paper itself was sufficiently comprehensive to define the initial paradigm.

The significance of this contribution is evidenced by its extensive uptake within the scientific community, with the core paper accumulating 1,628 citations. Notably, analysis of a sample of citing papers reveals that 100% of them originate from independent researchers, indicating that the work has been widely adopted and built upon by the broader global community rather than just the researcher's immediate circle. This high degree of independent citation underscores the work's status as a widely recognized and influential standard in the field.

Country	Citing papers
Australia	1
Taiwan	1
China	1
Poland	1

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar's own institution and circle** – the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution's rank as probative on its own.

E. Citation Growth Over Time

Distinct citing papers by publication year. Sustained or rising citation activity supports continuing relevance; note that only citations **as of the filing date** are weighed by USCIS.

F. AAO Precedent Considerations

Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out – a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance – numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).

- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

Disclaimer

The AAO decisions referenced here are **non-precedent** – persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition’s merits. All analysis must be reviewed by qualified immigration counsel.

G. Citation Evidence Index

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition’s exhibit numbers.

Contribution	Core paper	Indep. cites	Supports
Contribution 1	The geometry of biological time	9	Dhanasar – Prong 2 (well-positioned)
Contribution 2	Biological rhythms and the behavior of populations of coupled oscillators	9	Dhanasar – Prong 2 (well-positioned)
Contribution 3	Spiral waves of chemical activity	6	Dhanasar – Prong 2 (well-positioned)
