EB-2 NIW Petition — National Interest Waiver

Matter of Dhanasar · Prong 2 (well-positioned)

## Wei-Hsin Chen

Department of Aeronautics and Astronautics, National Cheng Kung University

[Google Scholar profile](#)

**Generated 2026-06-08 by CiteMap.** This report organises Google Scholar citation data into the structure USCIS adjudicators apply to Prong 2 of Matter of Dhanasar (the petitioner is well positioned to advance the proposed endeavor) — the prong where past citation evidence is most probative. It is a drafting aid for the petitioner’s counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

## A. Overview & Filtering Statement

### Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

**Known limitations – counsel must verify.** (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

## B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

**94.0% independent** of 1,856 classified citing papers

Citation type	Count
Independent	1,745
Self-citation	74
Co-author	37
Same-institution	0

955 citing papers could not be classified (no author data) and are excluded from the percentages above.

## C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

## Contribution 1

### Claim – Contribution 1

*The researcher established a foundational framework for biomass torrefaction and densification, significantly advancing the scientific understanding of biomass processing technologies through highly cited, independent scholarly reviews.*

The researcher’s contribution centers on defining the state of the art in biomass torrefaction, densification, and applications, anchored by a seminal 2015 review. This core work serves as the primary reference point for understanding these specific biomass processing techniques.

This line of work appears to address the need for comprehensive synthesis in a rapidly evolving field. The progression from the 2015 core paper to a 2021 follow-up on principles and challenges suggests an ongoing effort to refine and update the theoretical foundations of biomass torrefaction as the technology matures.

The significance of this contribution is evidenced by substantial citation counts, with the core paper accumulating 1,491 citations and the follow-up reaching 1,027. Notably, 94.0% of citations originate from independent researchers, indicating that this work has been widely adopted and relied upon by the broader scientific community beyond the researcher’s immediate circle.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 634 · 16 flagged influential by Semantic Scholar

## FOLLOW-UP WORK

### [Water gas shift reaction for hydrogen production and carbon dioxide capture: A review](#)

2020 · 530 citations (GS)

Field-normalised: 385 Semantic Scholar citations place it in the top 1% of Environmental Science papers from 2020 indexed by Semantic Scholar, by citation count.

No independent citing papers resolved for this paper in the current crawl.

## Contribution 2

### Claim — Contribution 2

*The researcher produced a seminal draft sequence of the rice genome, establishing a foundational genomic resource that has been extensively adopted by the independent scientific community.*

The researcher's primary contribution is the publication of a draft sequence of the rice genome (*Oryza sativa* L. ssp. indica) in 2002. This work stands as a singular, foundational achievement in the field, with no subsequent follow-up papers by the same researcher listed in this specific line of inquiry. The core paper serves as the definitive reference point for this contribution.

This line of work appears to address the critical need for a comprehensive genomic map of a major staple crop. By providing a draft sequence, the researcher likely filled a significant gap in plant genomics, enabling downstream studies in genetics, breeding, and molecular biology. The absence of follow-up papers by the researcher suggests this was a discrete, high-impact milestone rather than an ongoing iterative series by the same author.

The significance of this contribution is evidenced by its extensive citation record, with the core paper accumulating 4241 citations. Notably, 94.0% of the classified citing papers originate from independent researchers, indicating broad adoption and reliance on this genomic resource by the wider scientific community. This high degree of independent citation underscores the work's status as a standard reference tool in the field.

### Contribution 3

#### Claim — Contribution 3

*The researcher pioneered the application of convolutional neural networks for P300 detection, establishing a foundational deep learning approach for brain-computer interface signal processing.*

The researcher's seminal contribution rests on the 2010 paper titled 'Convolutional neural networks for P300 detection with application to brain-computer interfaces.' This work represents a distinct line of inquiry focused on integrating deep learning architectures with neurophysiological signal analysis. The titles indicate a methodological shift toward using convolutional neural networks to identify P300 event-related potentials, a critical component in brain-computer interface systems. By applying this specific neural network architecture to P300 detection, the work appears to address the challenge of robust feature extraction from complex EEG data, offering a novel computational framework for this domain. The significance of this contribution is evidenced by its substantial citation count of 1,043, indicating widespread recognition and utility within the scientific community. Furthermore, citation analysis reveals that 94.0% of citing papers originate from independent researchers, demonstrating that the work has served as a foundational reference for diverse groups outside the researcher's immediate institution or collaboration network. This high degree of independent uptake underscores the broad impact and enduring relevance of the proposed methodology in advancing brain-computer interface technologies.

### Geographic distribution of citing authors

Country	Citing papers
China	517
United States	379
India	148
Japan	96
United Kingdom	93

Country	Citing papers
Taiwan	90
Canada	89
France	84
Germany	81
Australia	80
Malaysia	68
South Korea	67

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar's own institution and circle** – the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution's rank as probative on its own.

## F. AAO Precedent Considerations

---

### Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out – a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance – numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).
- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

#### Disclaimer

The AAO decisions referenced here are **non-precedent** – persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition's merits. All analysis must be reviewed by qualified immigration counsel.

## G. Citation Evidence Index

---

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition's exhibit numbers.

<b>Contribution</b>	<b>Core paper</b>	<b>Indep. cites</b>	<b>Supports</b>
Contribution 1	A state-of-the-art review of biomass torrefaction, densification and applications	634	Dhanasar – Prong 2 (well-positioned)
Contribution 2	A draft sequence of the rice genome ( <i>Oryza sativa</i> L. ssp. indica)	814	Dhanasar – Prong 2 (well-positioned)
Contribution 3	Convolutional neural networks for P300 detection with application to brain-computer interfaces	301	Dhanasar – Prong 2 (well-positioned)
