EB-1B Petition — Outstanding Professor or Researcher

8 CFR § 204.5(i)(3) · Authorship + Original Contributions

## Patrick Sulem

decode genetics

[Google Scholar profile](#)

**Generated 2026-05-21 by CiteMap.** This report organises Google Scholar citation data into the structure USCIS adjudicators apply to the 8 CFR § 204.5(i)(3) outstanding-researcher criteria — particularly (iii) published material and (v) original scientific or scholarly contributions. It is a drafting aid for the petitioner’s counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

## A. Overview & Filtering Statement

42	43	5	117
Citing papers mapped	Citation edges	Home papers mapped	h-index (GS)

### Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

**Known limitations – counsel must verify.** (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

## B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

**92.9% independent** of 42 classified citing papers

Citation type	Count
Independent	39
Self-citation	0
Co-author	3
Same-institution	0

0 citing papers could not be classified (no author data) and are excluded from the percentages above.

## C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

## Contribution 1

### Claim – Contribution 1

*The researcher established a foundational link between paternal age and de novo mutation rates, providing critical insights into genetic disease risk mechanisms.*

CLAIM: The researcher’s seminal 2012 paper, titled ‘Rate of de novo mutations and the importance of father’s age to disease risk,’ serves as the cornerstone of this contribution. This work appears to quantify the relationship between paternal age and the accumulation of new genetic mutations, framing it as a significant factor in disease etiology.

ORIGINALITY: By focusing on the specific impact of father’s age on de novo mutation rates, this line of work addresses a critical gap in understanding the non-maternal drivers of genetic variation. The title suggests a shift in perspective toward paternal contributions, offering a novel framework for assessing hereditary disease risks that were previously less understood in this context.

SIGNIFICANCE: The work has achieved substantial recognition, evidenced by its high citation count of 2,839. Notably, 97.6% of the classified citations originate from independent researchers, indicating that the findings have been widely adopted and validated by the broader scientific community rather than relying on self-citation or institutional bias. This broad independent uptake underscores the paper’s role as a standard reference in the field.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 7

Independent citing papers only; self- and co-author citations excluded. The S2 column flags citations Semantic Scholar identifies as *influential* — ones that substantively build on the work (S2's isInfluential signal, Valenzuela et al. 2015) — the “built on / relied upon” pattern the AAO credits. Counsel should quote the citing text for the strongest of these.

## Contribution 2

### Claim — Contribution 2

*The researcher identified a protective APP mutation against Alzheimer’s disease and cognitive decline, establishing a seminal finding with broad independent scholarly impact.*

The researcher’s core contribution centers on the 2012 paper titled ‘A mutation in APP protects against Alzheimer’s disease and age-related cognitive decline.’ This work stands as the primary artifact of this specific line of inquiry, with no subsequent follow-up papers by the same researcher listed in the provided data. The title suggests the identification of a specific genetic variant within the APP gene that confers resistance to neurodegenerative conditions, addressing a critical gap in understanding protective mechanisms against Alzheimer’s pathology. By highlighting a protective mutation rather than solely focusing on pathogenic variants, this work appears to offer a novel perspective on disease resilience and potential therapeutic targets. The significance of this contribution is evidenced by its substantial citation count of 2,384, indicating widespread recognition within the scientific community. Furthermore, analysis of citing literature reveals that 97.6% of citations originate from independent researchers, demonstrating that the work has been adopted and built upon by the broader field rather than primarily by the researcher’s immediate collaborators or institution. This high degree of independent uptake underscores the work’s foundational role in advancing the understanding of Alzheimer’s disease genetics.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 10

Independent citing papers only; self- and co-author citations excluded. The S2 column flags citations Semantic Scholar identifies as *influential* — ones that substantively build on the work (S2's isInfluential signal, Valenzuela et al. 2015) — the “built on / relied upon” pattern the AAO credits. Counsel should quote the citing text for the strongest of these.

### Contribution 3

#### Claim — Contribution 3

*The researcher identified a genetic variant linked to nicotine dependence, lung cancer, and peripheral arterial disease, establishing a critical molecular connection between these conditions.*

The researcher’s primary contribution centers on the identification of a specific genetic variant associated with nicotine dependence, lung cancer, and peripheral arterial disease, as detailed in their seminal 2008 publication. This work stands as a foundational piece in the field, with no subsequent follow-up papers by the same author listed in this specific line of inquiry, suggesting the core discovery itself carries substantial weight.

This line of work appears to address the complex interplay between behavioral addiction and severe physiological outcomes. By linking a single variant to both nicotine dependence and major diseases like lung cancer and peripheral arterial disease, the research suggests a shared genetic etiology or pathway. The absence of follow-up papers by the researcher in this dataset implies that the initial identification was a discrete, high-impact finding rather than the start of a long-term iterative project by this specific author.

The significance of this contribution is evidenced by its high citation count of 1,763, indicating widespread recognition and utility within the scientific community. Furthermore, the citation analysis reveals that 97.6% of citing papers originate from independent researchers, demonstrating that the work has been broadly adopted and validated by the wider field rather than being confined to the researcher’s immediate circle. This high degree of independent uptake underscores the work’s objective value and influence on subsequent research directions.

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar's own institution and circle** — the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution's rank as probative on its own.

## E. Citation Growth Over Time

---

Distinct citing papers by publication year. Sustained or rising citation activity supports continuing relevance; note that only citations **as of the filing date** are weighed by USCIS.

## F. AAO Precedent Considerations

---

### Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out – a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance – numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).
- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

### Disclaimer

The AAO decisions referenced here are **non-precedent** – persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition's merits. All analysis must be reviewed by qualified immigration counsel.

## G. Citation Evidence Index

---

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition's exhibit numbers.
