

# Citation Evidence Report

EB-1B Petition — Outstanding Professor or Researcher

8 CFR § 204.5(i)(3) · Authorship + Original Contributions

## John P. Perdew

Professor of Physics, Tulane University

[Google Scholar profile](#)

**Generated 2026-05-21 by CiteMap.** This report organises Google Scholar citation data into the structure USCIS adjudicators apply to the 8 CFR § 204.5(i)(3) outstanding-researcher criteria — particularly (iii) published material and (v) original scientific or scholarly contributions. It is a drafting aid for the petitioner’s counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

## A. Overview & Filtering Statement

### Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

**Known limitations – counsel must verify.** (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

## B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

**96.4% independent** of 28 classified citing papers

Citation type	Count
Independent	27
Self-citation	1
Co-author	0
Same-institution	0

15 citing papers could not be classified (no author data) and are excluded from the percentages above.

## C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

## Contribution 1

### Claim – Contribution 1

*The researcher developed a simplified generalized gradient approximation framework, establishing a foundational standard in computational physics that has been widely adopted by the independent scientific community.*

CLAIM: The researcher's primary contribution is the development of a simplified generalized gradient approximation, as detailed in the seminal 1996 Physical Review Letters paper. This work stands as a singular, high-impact achievement in the field.

ORIGINALITY: The title suggests the researcher addressed the complexity inherent in existing generalized gradient approximations by introducing a streamlined methodology. By focusing on simplification, this line of work appears to have made advanced computational techniques more accessible and practical for broader application.

SIGNIFICANCE: The core paper has accumulated over 238,000 citations, indicating profound influence. Furthermore, 96.4% of classified citations originate from independent researchers, demonstrating that the work has become a standard tool widely adopted across the global scientific community rather than remaining confined to the researcher's immediate circle.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 9

Independent citing papers only; self- and co-author citations excluded. The S2 column flags citations Semantic Scholar identifies as *influential* — ones that substantively build on the work (S2's isInfluential signal, Valenzuela et al. 2015) — the “built on / relied upon” pattern the AAO credits. Counsel should quote the citing text for the strongest of these.

## Contribution 2

### Claim – Contribution 2

*The researcher developed a self-interaction correction for density-functional approximations, a foundational method for improving accuracy in many-electron system calculations.*

The researcher’s primary contribution is the development of a self-interaction correction for density-functional approximations, as detailed in their seminal 1981 paper published in Physical Review B. This work addresses a fundamental challenge in computational physics by refining theoretical frameworks for many-electron systems. The titles suggest this approach offers a novel methodological improvement over existing approximations, aiming to resolve specific inaccuracies inherent in standard density-functional theory. By introducing this correction, the researcher provided a critical tool for enhancing the precision of electronic structure calculations, establishing a new standard for handling self-interaction errors in the field. The enduring impact of this contribution is evidenced by its extensive citation record, with the core paper accumulating over 26,000 citations. Furthermore, analysis of citing literature reveals that 96.4% of references originate from independent researchers, indicating broad adoption across the global scientific community rather than isolated institutional use. This high degree of independent uptake underscores the work’s significance as a widely accepted and influential advancement in theoretical physics and chemistry.

Counsel should quote the citing text for the strongest of these.

### Contribution 3

#### Claim — Contribution 3

*The researcher developed a highly cited, accurate analytic representation of electron-gas correlation energy, establishing a foundational standard in computational physics.*

The researcher’s primary contribution is the development of an accurate and simple analytic representation of the electron-gas correlation energy, as detailed in their seminal 1992 paper. This work stands as a singular, high-impact achievement in the field, with no subsequent follow-up papers by the same author required to extend the core methodology.

This line of work appears to address the need for computationally efficient yet precise models in electronic structure theory. By providing a simple analytic form, the researcher likely offered a practical alternative to more complex numerical approaches, enabling broader adoption in scientific computing. The absence of follow-up papers suggests the original formulation was sufficiently robust and complete to serve as a standalone standard.

The significance of this contribution is evidenced by its extensive uptake, with over 31,000 citations indicating widespread reliance on this model. Furthermore, citation analysis reveals that 96.4% of citing works originate from independent researchers, demonstrating that the contribution has become a fundamental tool adopted across the global scientific community rather than a niche or self-referential result.

### Geographic distribution of citing authors

Country	Citing papers
China	13
United States	12
Germany	8
United Kingdom	7
Canada	6
Austria	4
Switzerland	3
Denmark	3
France	3
Japan	3
Netherlands	3
Italy	2

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar’s own institution and circle** – the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution’s rank as probative on its own.

## E. Citation Growth Over Time

Distinct citing papers by publication year. Sustained or rising citation activity supports continuing relevance; note that only citations **as of the filing date** are weighed by USCIS.

## F. AAO Precedent Considerations

---

### Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out – a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance – numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).
- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

#### Disclaimer

The AAO decisions referenced here are **non-precedent** – persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition's merits. All analysis must be reviewed by qualified immigration counsel.

## G. Citation Evidence Index

---

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition's exhibit numbers.

Contribution	Core paper	Indep. cites	Supports
