[Google Scholar profile](#)

Generated 2026-05-21 by CiteMap. This report organises Google Scholar citation data into the structure USCIS adjudicators apply to Prong 2 of Matter of Dhanasar (the petitioner is well positioned to advance the proposed endeavor) — the prong where past citation evidence is most probative. It is a drafting aid for the petitioner’s counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

A. Overview & Filtering Statement

Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

Known limitations – counsel must verify. (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

94.3% independent of 1,477 classified citing papers

Citation type	Count
Independent	1,393
Self-citation	0
Co-author	83
Same-institution	1

2,744 citing papers could not be classified (no author data) and are excluded from the percentages above.

C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

Contribution 1

Claim – Contribution 1

The researcher established a foundational framework for optimizing surgical timing and managing thromboembolic risks in patients with prior SARS-CoV-2 infection through seminal and subsequent international cohort studies.

The researcher's contribution centers on defining safe surgical protocols for patients with a history of SARS-CoV-2 infection. This line of work is anchored by the 2020 core paper, "Delaying surgery for patients with a previous SARS-CoV-2 infection," which appears to have initiated a critical dialogue on perioperative management during the pandemic.

Originality is suggested by the chronological progression from initial guidance on delaying procedures to more granular, data-driven investigations. The follow-up studies, including a 2021 international prospective cohort on timing and a 2022 study on venous thromboembolism, indicate an evolution from general recommendations to specific, evidence-based risk assessments derived from large-scale global data.

The significance of this work is evidenced by substantial citation counts, with the core paper accumulating 163 citations and the 2021 follow-up reaching 672. Furthermore, the high degree of citation independence, with 97.6% of citations originating from independent researchers, suggests that this framework has been widely adopted and validated by the broader medical community beyond the researcher's immediate network.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 496 · 13 flagged influential by Semantic Scholar

Contribution 2

Claim – Contribution 2

The researcher established a global evidence base on pandemic impacts on cancer surgery and developed validated metrics for international surgical system preparedness.

CLAIM: The researcher’s contribution centers on quantifying the global disruption of cancer surgeries during the COVID-19 pandemic and subsequently developing standardized tools to measure surgical system resilience. This line of work is anchored by a 2021 prospective cohort study covering 15 tumor types across 61 countries, which has accumulated 335 citations. It is extended by 2022 publications that introduce and validate a Surgical Preparedness Index across 1,632 hospitals in 119 countries.

ORIGINALITY: The titles suggest a strategic evolution from documenting crisis-induced service interruptions to establishing proactive frameworks for system strengthening. While the core paper addresses the immediate impact of lockdowns on planned procedures, the follow-up work appears to fill a gap in standardized measurement by creating a validated index for surgical preparedness. This progression indicates a shift from descriptive epidemiology to the development of actionable metrics for global health infrastructure.

SIGNIFICANCE: The work demonstrates substantial independent uptake, with 97.6% of citations originating from researchers outside the scholar’s immediate network. The core paper’s high citation count reflects its role as a key reference for understanding pandemic effects on oncology care. The subsequent development of the preparedness index, cited in multiple publications, suggests the field is adopting these metrics to assess and improve surgical capacity on a global scale.

FOLLOW-UP WORK

[Elective surgery system strengthening: development, measurement, and validation of the surgical preparedness index across 1632 hospitals in 119 countries](#)

2022 · The Lancet 400 (10363), 1607-1617, 2022 · 54 citations (GS)

Field-normalised: 55 Semantic Scholar citations place it in the top 5% of Medicine papers from 2022 indexed by Semantic Scholar, by citation count.

No.	Citing paper	Citing institution(s)	Country	S2
1	Prophylactic anticoagulants for non-hospitalised people with COVID-19	—	—	—
2	Pulmonary and functional hallmarks after SARS-CoV-2 infection across three WHO severity level-groups: an observational study	São Francisco University, University of Campinas	Brazil	—
3	Epidemiological profile of hospitalized patients with cystic fibrosis in Brazil due to severe acute respiratory infection during the COVID-19 pandemic and a ...	Universidade São Francisco	Brazil	—
4	Neurosurgical operative cancellations in Canada: a multicentre retrospective cohort study	Dalhousie University, McMaster University, Queen's University	Canada	—
5	Measuring hospital care resilience: a systematic literature review: M. Cavalieri et al.	University of Catania	Italy	—
6	Impact of coronavirus disease 2019 on the number of newly diagnosed cancer patients and examinations and surgeries performed for cancer in Japan: a nationwide ...	Japan Cancer Society, Jichi Medical University, Kanagawa Prefectural Ashigarakami Hospital	Japan	—
7	Worse cholecystectomy outcomes during the COVID-19 pandemic: were staff shortages or a change in patient case-mix the culprit?	Evangelical Hospital, Knappschaft Vest-Hospital, University of Cologne	Germany	—
8	Healthcare as a driver, reservoir and amplifier of antimicrobial resistance: opportunities for interventions	University of Liverpool	United Kingdom	—
9	Long-term therapy with dienogest or other oral cyclic estrogen-progestogen can reduce the need for ovarian endometrioma surgery	University of Brescia, University of Insubria, University of Palermo	Italy	—

No.	Citing paper	Citing institution(s)	Country	S2
10	The impact of COVID-19 on plastic surgery residents across the world: a country-, region-, and income-level analysis	International Society of Aesthetic Plastic Surgery, University Hospital of Ioannina	Greece, United States	—
11	Assessing the impact of neurosurgery and neuroanatomy simulation using 3D non-cadaveric models amongst selected African medical students	Association of Future African Neurosurgeons, University of Bamenda, University of Yaounde I	Cameroon	—
12	A narrative on diversity, equity, and inclusion in surgery: insights from the European Society of Coloproctology and identification of points for action	Acibadem Mehmet Ali Aydinlar University, ESCP, Hospital L. Sacco	Argentina, Italy, Switzerland	—
13	Exploring factors contributing to patient decision-making in the care journey to elective hernia care in Kenya	Indiana University School of Medicine, Moi University School of Medicine, National Institutes of Health	Kenya, United States	—
14	Association Between Colorectal Cancer Screening and Survival in Patients Older Than 70 Years: Results of A National Multicenter Retrospective Study	Humanitas University, University Hospital of Trieste	Italy	—
15	Risk factors for postoperative bile leakage and mortality following bilio-enteric anastomosis: a prospective cohort study	University of Oran 1	Algeria	—
16	The burden of COVID-19 in hospitalized people with diabetes mellitus in Brazil: Insights from four years of the pandemic	São Francisco University, Universidade São Francisco	Brazil	—
17	Epidemiologische Auswirkungen der COVID-19-Pandemie auf Enukeationsfälle in Deutschland	Universitätsklinikum Gießen und Marburg GmbH, Universitätsklinikum Gießen und Marburg GmbH, Standort Gießen, Justus-Liebig-Universität Gießen	Germany	—
18	Strategic use of emergency operating rooms for elective surgery under the TACS code white	Azienda Unità Sanitaria Locale (AUSL) Romagna, Maurizio Bufalini Hospital, Maurizio Bufalini Hospital	Italy	—
19	Before and after COVID-19 pandemic: impact on hepatobiliary and pancreatic surgical services in a Singapore Tertiary Hospital	Nanyang Technological University	Singapore	—
20	Will the epidemic wave of Chikungunya affect the surgical management of the patients?	Universidad Nacional de Asunción	Paraguay	—

Independent citing papers only; self- and co-author citations excluded. The S2 column flags citations Semantic Scholar identifies as *influential* — ones that substantively build on the work (S2's isInfluential signal, Valenzuela et al. 2015) — the “built on / relied upon” pattern the AAO credits. Counsel should quote the citing text for the strongest of these.

FOLLOW-UP WORK

[Elective surgery system strengthening development, measurement, and validation of the surgical preparedness index across 1632 hospitals in 119 countries](#)

2022 · Elsevier, 2022 · 1 citations (GS)

Field-normalised: 55 Semantic Scholar citations place it in the top 5% of Medicine papers from 2022 indexed by Semantic Scholar, by citation count.

No.	Citing paper	Citing institution(s)	Country	S2
1	Quality indicators for structure and process in peri-operative care: a systematic review	University of Cambridge	United Kingdom	—

Independent citing papers only; self- and co-author citations excluded. The S2 column flags citations Semantic Scholar identifies as *influential* — ones that substantively build on the work (S2's isInfluential signal, Valenzuela et al. 2015) — the “built on / relied upon” pattern the AAO credits. Counsel should quote the citing text for the strongest of these.

Contribution 3

Claim — Contribution 3

The researcher developed a seminal vaccination modeling framework for safe surgery during the pandemic, establishing a foundation for subsequent analyses on hospital preparedness and global surgical economics.

The researcher's core contribution rests on a 2021 paper titled 'SARS-CoV-2 vaccination modelling for safe surgery to save lives: data from an international prospective cohort study.' This work appears to have established a critical methodological or empirical baseline for assessing surgical safety in the context of widespread vaccination efforts during the pandemic.

This line of work addresses the urgent need to quantify how vaccination impacts surgical outcomes. The titles of follow-up papers from 2025 and 2026 suggest the researcher expanded this initial focus to examine broader systemic factors, including hospital preparedness effects on postoperative mortality and global variations in out-of-pocket payments for cancer surgery. This progression indicates a sustained effort to understand the multifaceted impact of the pandemic on surgical care delivery and economics.

The significance of this contribution is evidenced by the core paper's 175 citations. Notably, 97.6% of the citing papers are from independent researchers, indicating that the work has been widely adopted and utilized by the broader scientific community beyond the researcher's immediate circle. This high level of independent uptake underscores the utility and impact of the initial modeling framework.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 73

CORE PAPER

[SARS-CoV-2 vaccination modelling for safe surgery to save lives: data from an international prospective cohort study](#)

2021 · British Journal of Surgery 108 (9), 1056-1063, 2021 · 175 citations (GS)

Field-normalised: 103 Semantic Scholar citations place it in the top 5% of Medicine papers from 2021 indexed by Semantic Scholar, by citation count.

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar's own institution and circle** – the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution's rank as probative on its own.

F. AAO Precedent Considerations

Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out – a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance – numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).

- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).
- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

Disclaimer

The AAO decisions referenced here are **non-precedent** – persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition’s merits. All analysis must be reviewed by qualified immigration counsel.

G. Citation Evidence Index

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition’s exhibit numbers.

Contribution	Core paper	Indep. cites	Supports
Contribution 1	Delaying surgery for patients with a previous SARS-CoV-2 infection	496	Dhanasar – Prong 2 (well-positioned)
