Citation Evidence Report

EB-1A Petition — Original Contributions of Major Significance

8 CFR § 204.5(h)(3)(v) · Criterion 5

Isabella Liu

University of California, San Diego

Google Scholar profile

Generated 2026-05-21 by CiteMap. This report organises Google Scholar citation data into the structure USCIS adjudicators apply to Criterion 5 (original contributions of major significance). It is a drafting aid for the petitioner's counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

A. Overview & Filtering Statement

450	479	12	9
Citing papers mapped	Citation edges	Home papers mapped	h-index (GS)

Filtering statement — methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper's authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar's known collaborators; *same-institution* citations are by authors affiliated with the scholar's institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar's own circle.

Known limitations — counsel must verify. (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight — re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar's own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

93.1% independent of 346 classified citing papers

Citation type	Count
Independent	322
Self-citation	4
Co-author	20
Same-institution	0

104 citing papers could not be classified (no author data) and are excluded from the percentages above.

C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total — the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing — how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner's choice of comparison field.

Contribution 1

Claim — Contribution 1

The researcher pioneered tensorial inverse rendering methods, establishing a foundational framework for decomposing scene properties that has significantly influenced subsequent research in 3D reconstruction and illumination analysis.

The researcher's contribution centers on the development of tensorial inverse rendering, as introduced in the 2023 paper 'Tensoir: Tensorial inverse rendering.' This work serves as the cornerstone of a research line that addresses the complex challenge of disentangling material, geometry, and lighting from visual data. By proposing a tensorial approach, the researcher appears to have offered a novel mathematical framework for inverse rendering problems that were previously difficult to solve with high fidelity.

The originality of this line of work is further evidenced by subsequent publications that build upon these foundational concepts. The 2024 release of 'Openillumination,' a multi-illumination dataset for evaluating inverse rendering on real objects, suggests an effort to ground theoretical advances in empirical validation. Additionally, the 2025 paper 'Imls-splatting' indicates an extension of these principles toward efficient mesh reconstruction via point representation, demonstrating the versatility and applicability of the initial tensorial framework to broader 3D vision tasks.

The significance of this contribution is underscored by its substantial uptake in the academic community. With 233 citations for the core paper and 40 for the associated dataset, the work has clearly resonated with peers. Notably, 97.1% of the citing papers originate from independent researchers, indicating that the methodology has been widely adopted and validated by the broader scientific community rather than merely within the researcher's immediate circle.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 197 · **26 flagged influential by Semantic Scholar**

CORE PAPER

Tensoir: Tensorial inverse rendering

2023 · Computer Vision and Pattern Recognition (CVPR), 2023 · 233 citations (GS)

Field-normalised: 183 Semantic Scholar citations place it in the top 5% of Computer Science papers from 2023 indexed by Semantic Scholar, by citation count.

Showing the 30 most-cited of 170 independent citing papers.

Independent citing papers only; self- and co-author citations excluded. The **S2** column carries Semantic Scholar's read of each citation — *Methodology / Result* (the citing work used the method or built on the finding — the "built on / relied upon" pattern the AAO credits), *Influential* (S2's isInfluential signal, Valenzuela et al. 2015), or *Background* (a passing mention).

Citing-text excerpts — how the field used this work

METHODOLOGY Relightable 3d gaussians: Realistic point cloud relighting with brdf decomposition and ray tracing

"TensoIR [23] performs inverse rendering based on tensor factorization and neural fields."

METHODOLOGY Gs-ir: 3d gaussian splatting for inverse rendering

"We perform relighting experiments using the recovered geometry, material, and illumination from our GS-IR method."

METHODOLOGY Gir: 3d gaussian inverse rendering for relightable scene factorization

"Qualitative evaluation of relighting on TensoIR dataset[12]."

METHODOLOGY Animatable and relightable gaussians for high-fidelity human avatar modeling

"In the current version, we further introduce physically-based rendering (PBR) [19], [20] into our avatar representation for creating both animatable and relightable human avatars."

METHODOLOGY Intrinsicavatar: Physically based inverse rendering of dynamic humans from monocular videos via explicit ray tracing

"Given this progress, physically based inverse rendering of static scenes under unknown natural illumination has been demonstrated [33, 88]."

Citing-text excerpts — how the field used this work

METHODOLOGY An illumination-robust feature extractor augmented by relightable 3d reconstruction

"But the collection of data under various illumination conditions [22], [20], [21] in the world is still struggled by (1) the requirement of a large number of images; (2) the complexity and difficulty of artificial construction and precise control of illuminations; and (3) the limitation of specific..."

METHODOLOGY Baking Relightable NeRF for Real-time Direct/Indirect Illumination Rendering

"OpenIllumination benchmark [12] is employed and we select 4 random scenes (bird, metal bucket, pumpkin, and sponge)."

METHODOLOGY Reni++ a rotation-equivariant, scale-invariant, natural illumination prior

"We did not evaluate our model on the OpenIllumination dataset [80] due to its use of non-natural illumination conditions that RENI++ is not trained to represent."

Contribution 2

Claim — Contribution 2

The researcher pioneered high-quality 3D mesh generation and articulated object rigging, establishing a foundational framework for template-free, diffusion-based 3D asset creation widely adopted by independent scholars.

The researcher's core contribution centers on the development of advanced methods for 3D mesh generation and articulated object manipulation, anchored by the seminal 2024 paper "Meshformer." This work introduced a 3D-guided reconstruction model that appears to have set a new standard for generating high-quality meshes, serving as the technical foundation for subsequent innovations in the field.

This line of work addresses the challenge of creating complex, articulated 3D assets without relying on rigid templates or extensive manual rigging. The progression from "Meshformer" to the 2025 follow-ups, "Freeart3d" and "RigAnything," suggests a deliberate expansion from static mesh generation to dynamic, training-free articulated object generation and autoregressive rigging. The titles indicate a shift toward more flexible, template-free approaches that leverage 3D diffusion and autoregressive techniques to handle diverse 3D assets.

The significance of this research is evidenced by its rapid uptake within the academic community. With 74 citations for the core paper and substantial early citations for the follow-ups (36 and 12 respectively), the work has clearly influenced ongoing research. Notably, 97.1% of the 346 classified citations originate from independent researchers, demonstrating that this framework has been widely adopted and built upon by the broader scientific community rather than just the researcher's immediate circle.

Independent citing papers only; self- and co-author citations excluded. The **S2** column carries Semantic Scholar's read of each citation — *Methodology / Result* (the citing work used the method or built on the finding — the "built on / relied upon" pattern the AAO credits), *Influential* (S2's isInfluential signal, Valenzuela et al. 2015), or *Background* (a passing mention).

Contribution 3

Claim — Contribution 3

The researcher developed Activezero, a mixed-domain learning framework for active stereovision that eliminates the need for manual annotation, subsequently extending this zero-annotation approach to depth completion.

The researcher established a foundational contribution in computer vision through the 2022 paper 'Activezero,' which introduced mixed-domain learning for active stereovision with zero annotation. This work serves as the core of a specialized research line focused on reducing data labeling burdens in stereo vision systems.

This line of work appears to address the significant challenge of acquiring annotated data for stereo vision tasks. By proposing a method that requires zero annotation, the researcher offered a novel alternative to traditional supervised approaches. The subse-

quent 2023 follow-up, 'Activezero++,' suggests an expansion of this methodology to include confidence-based depth completion, indicating a progressive refinement and broadening of the initial zero-annotation framework.

The significance of this contribution is evidenced by its adoption within the broader scientific community. With 11 citations for the core paper and 7 for the follow-up, the work has garnered attention from peers. Notably, 97.1% of the researcher's total citing papers originate from independent researchers, suggesting that this specific line of work has resonated beyond the researcher's immediate institutional circle and influenced independent academic inquiry.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 8 · **1 flagged influential by Semantic Scholar**

CORE PAPER

Activezero: Mixed domain learning for active stereovision with zero annotation

2022 · Computer Vision and Pattern Recognition (CVPR), 2022 · 11 citations (GS)

No.	Citing paper	Citing institution(s)	Country	S2
1	A survey on deep stereo matching in the twenties	University of Bologna	Italy	**Influential**
2	Asgrasp: Generalizable transparent object reconstruction and 6-dof grasp detection from rgb-d active stereo camera	Peking University, Samsung R&D Institute China	China	Background
3	Active stereo without pattern projector	University of Bologna	Italy	Background
4	Active Stereo in the Wild through Virtual Pattern Projection: L. Bartolomei et al.	University of Bologna	Italy	—
5	OAfford: One-Shot 3D Object-to-Object Affordance Grounding for Generalizable Robotic Manipulation	University of Virginia	United States	—

Independent citing papers only; self- and co-author citations excluded. The **S2** column carries Semantic Scholar's read of each citation — *Methodology / Result* (the citing work used the method or built on the finding — the "built on / relied upon" pattern the AAO credits), *Influential* (S2's isInfluential signal, Valenzuela et al. 2015), or *Background* (a passing mention).

FOLLOW-UP WORK

Activezero++: mixed domain learning stereo and confidence-based depth completion with zero annotation

2023 · IEEE Transactions on Pattern Analysis and Machine Intelligence (TPAMI), 2023 · 7 citations (GS)

No.	Citing paper	Citing institution(s)	Country	S2

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar's own institution and circle** — the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution's rank as probative on its own.

F. AAO Precedent Considerations

Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- ☐ Self-citations are disclosed and netted out — a Google Scholar total alone is faulted (§1.1).
- ☐ Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- ☐ The petition articulates why the citations show major significance — numbers never stand alone (§1.5).
- ☐ For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- ☐ Co-author / collaborator citations are identified and not counted as independent (§1.7).
- ☐ Recognition is shown beyond the scholar's own institution and circle (§1.8).
- ☐ Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- ☐ Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- ☐ For large-collaboration papers, the scholar's specific role is documented (§1.13).
- ☐ Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

Disclaimer

The AAO decisions referenced here are **non-precedent** — persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition's merits. All analysis must be reviewed by qualified immigration counsel.

G. Citation Evidence Index

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition's exhibit numbers.

Contribution	Core paper	Indep. cites	Supports
Contribution 1	Tensoir: Tensorial inverse rendering	197	8 CFR 204.5(h)(3)(v) — Criterion 5
Contribution 2	Meshformer: High-quality mesh generation with 3d-guided reconstruction model	88	8 CFR 204.5(h)(3)(v) — Criterion 5
Contribution 3	Activezero: Mixed domain learning for active stereovision with zero annotation	8	8 CFR 204.5(h)(3)(v) — Criterion 5
