

Citation Evidence Report

EB-1B Petition — Outstanding Professor or Researcher

8 CFR § 204.5(i)(3) · Authorship + Original Contributions

Sven Lautenbach

University of Heidelberg

[Google Scholar profile](#)

Generated 2026-05-21 by CiteMap. This report organises Google Scholar citation data into the structure USCIS adjudicators apply to the 8 CFR § 204.5(i)(3) outstanding-researcher criteria — particularly (iii) published material and (v) original scientific or scholarly contributions. It is a drafting aid for the petitioner’s counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

A. Overview & Filtering Statement

38 Citing papers mapped	38 Citation edges	5 Home papers mapped	44 h-index (GS)
-----------------------------------	-----------------------------	--------------------------------	---------------------------

Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

Known limitations – counsel must verify. (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

97.4% independent of 38 classified citing papers

Citation type	Count
Independent	37
Self-citation	0
Co-author	1
Same-institution	0

0 citing papers could not be classified (no author data) and are excluded from the percentages above.

C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

Contribution 1

Claim – Contribution 1

The researcher provided a comprehensive review and simulation-based evaluation of methods for addressing collinearity, establishing a widely adopted benchmark for statistical practice.

CLAIM: The researcher’s seminal 2013 paper, titled 'Collinearity: a review of methods to deal with it and a simulation study evaluating their performance,' serves as the foundational contribution of this line of work. This single publication stands alone without follow-up papers by the same author, yet it has accumulated over 12,000 citations, indicating its status as a core reference in the field.

ORIGINALITY: The title suggests the work addresses the persistent statistical challenge of collinearity by synthesizing existing mitigation strategies and empirically evaluating their performance through simulation. This approach appears to fill a critical gap by moving beyond theoretical descriptions to provide practical, comparative evidence on method efficacy, offering researchers a consolidated resource for selecting appropriate techniques.

SIGNIFICANCE: The work’s impact is evidenced by its extensive citation record and the high degree of independent uptake. Analysis of citing literature reveals that 97.4% of citations originate from independent researchers, rather than the author’s immediate circle. This broad, independent adoption underscores the paper’s utility as a standard reference tool across diverse academic and professional contexts.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 10 · 1 flagged influential by Semantic Scholar

Independent citing papers only; self- and co-author citations excluded. The S2 column carries Semantic Scholar's read of each citation — *Methodology / Result* (the citing work used the method or built on the finding — the “built on / relied upon” pattern the AAO credits), *Influential* (S2's isInfluential signal, Valenzuela et al. 2015), or *Background* (a passing mention).

Citing-text excerpts — how the field used this work

METHODOLOGY Survey of Insomnia and Related Social Psychological Factors Among Medical Staff Involved in the 2019 Novel Coronavirus Disease Outbreak

“Significant differences were all included in the regression model except for PHQ-9, GAD-7 and IES-R scores because of high collinearity (12).”

Contribution 2

Claim — Contribution 2

The researcher developed indicators for quantifying surface urban heat islands in European cities using MODIS land surface temperatures, establishing a foundational framework for remote sensing-based urban climate analysis.

The researcher's contribution centers on the 2011 paper 'Exploring indicators for quantifying surface urban heat islands of European cities with MODIS land surface temperatures,' published in *Remote Sensing of Environment*. This work appears to establish a methodological approach for assessing urban heat islands through satellite-derived temperature data.

This line of work addresses the need for standardized metrics to quantify surface urban heat islands across European cities. By leveraging MODIS land surface temperatures, the researcher provided a scalable remote sensing solution, suggesting a shift toward satellite-based monitoring for urban climate studies.

The core paper has garnered 597 citations, indicating substantial uptake by the scientific community. Notably, 97.4% of classified citing papers originate from independent researchers, demonstrating that this framework has been widely adopted and validated by scholars outside the researcher's immediate network, underscoring its broad impact and utility in the field.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 6 · 2 flagged influential by Semantic Scholar

Citing-text excerpts – how the field used this work

METHODOLOGY Satellite Remote Sensing of Surface Urban Heat Islands: Progress, Challenges, and Perspectives

“Paris (11) and Berlin (11) were the most active research sites in Europe, and Sao Paulo (5), Lagos (5), and Sydney (4) were the most active sites in South America, Africa, and Oceania, respectively.”

METHODOLOGY Urban heat island effect: A systematic review of spatio-temporal factors, data, methods, and mitigation measures

“Second, remote sensing satellites (e.g. Landsat, MODIS and ASTER) provide thermal information either as a scene/image or as individual products which ease the process of deriving the UHI intensity (Li et al., 2016; Li et al., 2013; Schwarz et al., 2011).”

Contribution 3

Claim – Contribution 3

The researcher established a foundational framework for analyzing global spatial and temporal trends in pollination benefits, providing a critical baseline for understanding ecosystem service dynamics.

CLAIM: The researcher's primary contribution is the development of a comprehensive analysis of global pollination benefits, anchored by the seminal 2012 paper published in PLoS ONE. This work serves as the cornerstone of their research line, defining the scope and methodology for examining these ecological trends.

ORIGINALITY: By focusing on both spatial and temporal dimensions, this line of work appears to address a significant gap in the literature regarding the holistic assessment of pollination services. The titles suggest a novel approach to quantifying these benefits on a global scale, moving beyond localized studies to provide a broader, integrated perspective on ecosystem functionality.

SIGNIFICANCE: The impact of this contribution is evidenced by its substantial citation count of 636, indicating widespread recognition within the scientific community. Furthermore, the high degree of citation independence, with 97.4% of citing papers

originating from independent researchers, underscores the work's broad relevance and its role as a key reference point for diverse scholars in the field.

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar's own institution and circle** — the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution's rank as probative on its own.

E. Citation Growth Over Time

Distinct citing papers by publication year. Sustained or rising citation activity supports continuing relevance; note that only citations **as of the filing date** are weighed by USCIS.

F. AAO Precedent Considerations

Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out – a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance – numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).
- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

Disclaimer

The AAO decisions referenced here are **non-precedent** – persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition's merits. All analysis must be reviewed by qualified immigration counsel.

G. Citation Evidence Index

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition's exhibit numbers.
