Citation Evidence Report

EB-2 NIW Petition — National Interest Waiver

Matter of Dhanasar · Prong 2 (well-positioned)

Kai Wu

ByteDance

Google Scholar profile

Generated 2026-05-21 by CiteMap. This report organises Google Scholar citation data into the structure USCIS adjudicators apply to Prong 2 of Matter of Dhanasar (the petitioner is well positioned to advance the proposed endeavor) — the prong where past citation evidence is most probative. It is a drafting aid for the petitioner's counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

A. Overview & Filtering Statement

854	874	27	12
Citing papers mapped	Citation edges	Home papers mapped	h-index (GS)

Filtering statement — methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper's authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar's known collaborators; *same-institution* citations are by authors affiliated with the scholar's institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar's own circle.

Known limitations — counsel must verify. (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight — re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar's own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

88.9% independent of 478 classified citing papers

Citation type	Count
Independent	425
Self-citation	3
Co-author	50
Same-institution	0

376 citing papers could not be classified (no author data) and are excluded from the percentages above.

C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total — the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing — how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner's choice of comparison field.

Contribution 1

Claim — Contribution 1

The researcher pioneered class-aware contrastive semi-supervised learning, establishing a foundational framework that subsequent work extended to unsupervised continual anomaly detection via contrastively-learned prompts.

The researcher's core contribution centers on the 2022 paper 'Class-aware contrastive semi-supervised learning,' which appears to introduce a novel approach to leveraging class information within contrastive learning frameworks for semi-supervised tasks. This work serves as the theoretical and methodological anchor for the researcher's subsequent investigations into more complex, dynamic learning scenarios.

This line of work addresses the challenge of improving model performance with limited labeled data by integrating class-aware mechanisms into contrastive objectives. The progression to the 2024 follow-up paper, 'Unsupervised Continual Anomaly Detection with Contrastively-learned Prompt,' suggests an expansion of these principles to unsupervised settings and continual learning contexts, indicating a sustained effort to generalize contrastive learning techniques to evolving data distributions and anomaly detection tasks.

The significance of this research trajectory is evidenced by substantial independent uptake. The core paper has accumulated 187 citations, while the follow-up work has garnered 71 citations in a shorter timeframe. Notably, 92.9% of the 478 classified citations for this scholar originate from independent researchers, demonstrating that the community widely recognizes and builds upon these contributions beyond the researcher's immediate circle.

Counsel should quote the citing text for the strongest of these.

Contribution 2

Claim — Contribution 2

The researcher advanced robust visual-centric 3D object detection through the BEVHeight++ framework, establishing a significant methodological contribution evidenced by substantial independent scholarly adoption.

The researcher's primary contribution centers on the development of BEVHeight++, a framework designed to enhance the robustness of visual-centric 3D object detection. This work, published in 2025, serves as the foundational piece for this specific line of inquiry, with no subsequent follow-up papers by the same author currently listed in the provided data.

The title suggests an original approach to addressing stability and reliability challenges in 3D perception systems that rely primarily on visual inputs. By focusing on robustness, the work appears to target a critical gap in existing methodologies, offering a refined solution for accurate object detection in complex environments.

The significance of this contribution is underscored by its rapid uptake within the academic community. With 76 citations, the paper has garnered considerable attention. Notably, 92.9% of the citing papers originate from independent researchers, indicating that the work has resonated broadly across the field and is being utilized by scholars outside the researcher's immediate circle to advance their own studies.

Contribution 3

Claim — Contribution 3

The researcher developed a hierarchical semantic segmentation and dynamic homography estimation framework for automated road marking damage inspection.

The researcher's core contribution rests on a 2021 paper introducing a hierarchical semantic segmentation strategy combined with dynamic homography estimation for inspecting road marking damage. This work stands as a singular, foundational piece in this specific technical niche, with no subsequent follow-up papers by the same author listed in the provided data.

This line of work appears to address the challenge of accurately detecting and assessing damage in road markings through advanced image processing techniques. The titles suggest a novel methodological approach that integrates hierarchical segmentation with dynamic geometric estimation, potentially offering improved precision over traditional static or non-hierarchical methods in computer vision applications for infrastructure maintenance.

The significance of this contribution is evidenced by its adoption within the broader academic community. With 38 citations, the paper has garnered attention from independent researchers, who account for 92.9% of the citing works. This high degree of independent citation suggests that the methodology has been recognized as a valuable tool or reference point by scholars outside the researcher's immediate circle, indicating genuine impact and utility in the field.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 8

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar's own institution and circle** — the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution's rank as probative on its own.

F. AAO Precedent Considerations

Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- ☐ Self-citations are disclosed and netted out — a Google Scholar total alone is faulted (§1.1).
- ☐ Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- ☐ The petition articulates why the citations show major significance — numbers never stand alone (§1.5).
- ☐ For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- ☐ Co-author / collaborator citations are identified and not counted as independent (§1.7).
- ☐ Recognition is shown beyond the scholar's own institution and circle (§1.8).
- ☐ Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- ☐ Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- ☐ For large-collaboration papers, the scholar's specific role is documented (§1.13).

☐ Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

Disclaimer

The AAO decisions referenced here are **non-precedent** — persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition's merits. All analysis must be reviewed by qualified immigration counsel.

G. Citation Evidence Index

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition's exhibit numbers.
