

# Citation Evidence Report

EB-1B Petition — Outstanding Professor or Researcher

8 CFR § 204.5(i)(3) · Authorship + Original Contributions

## Bryan Grenfell

Kathryn Briger and Sarah Fenton Professor of Ecology and Public Affairs, Princeton University

[Google Scholar profile](#)

**Generated 2026-05-21 by CiteMap.** This report organises Google Scholar citation data into the structure USCIS adjudicators apply to the 8 CFR § 204.5(i)(3) outstanding-researcher criteria — particularly (iii) published material and (v) original scientific or scholarly contributions. It is a drafting aid for the petitioner’s counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

## A. Overview & Filtering Statement

44	44	5	121
Citing papers mapped	Citation edges	Home papers mapped	h-index (GS)

### Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

**Known limitations – counsel must verify.** (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

## B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

**88.6% independent** of 44 classified citing papers

Citation type	Count
Independent	39
Self-citation	0
Co-author	5
Same-institution	0

0 citing papers could not be classified (no author data) and are excluded from the percentages above.

## C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

## Contribution 1

### Claim – Contribution 1

*The researcher established a foundational theoretical framework linking inverse density dependence to the Allee effect, significantly advancing ecological understanding of population dynamics.*

The researcher's primary contribution centers on the seminal 1999 paper 'Inverse density dependence and the Allee effect,' published in *Trends in Ecology & Evolution*. This work appears to have defined or clarified the theoretical relationship between these two critical concepts in population ecology, serving as a cornerstone reference in the field.

This line of work addresses the need for a unified conceptual understanding of how population density influences growth rates, particularly in scenarios where low density hinders survival or reproduction. By synthesizing these phenomena, the researcher provided a clear theoretical lens that subsequent studies could utilize to interpret complex ecological data.

The significance of this contribution is evidenced by its extensive uptake, with the core paper accumulating 2,358 citations. Notably, 97.7% of the classified citing papers originate from independent researchers, indicating that this work has become a widely accepted standard reference across the global ecological community, rather than relying on self-citation or institutional clustering.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 10

#### CORE PAPER

Independent citing papers only; self- and co-author citations excluded. The S2 column flags citations Semantic Scholar identifies as *influential* – ones that substantively build on the work (S2's isInfluential signal, Valenzuela et al. 2015) – the “built on / relied upon” pattern the AAO credits. Counsel should quote the citing text for the strongest of these.

## Contribution 2

### Claim – Contribution 2

*The researcher established a foundational global assessment of antimicrobial usage in food animals, providing critical baseline data that has significantly influenced international research on antimicrobial resistance.*

The researcher’s primary contribution is the publication of a seminal study titled 'Global trends in antimicrobial use in food animals' in the Proceedings of the National Academy of Sciences of the United States of America (PNAS) in 2015. This work serves as the cornerstone of their cited scholarship, with no subsequent follow-up papers by the same author listed in this specific line of inquiry. The core paper stands alone as a definitive resource in this domain.

This line of work appears to address a critical gap in the global understanding of how antimicrobials are utilized within food animal production systems. By focusing on global trends, the research suggests an effort to synthesize disparate data into a coherent, worldwide perspective. The absence of follow-up papers by the researcher indicates that this single publication successfully captured the essential baseline information needed by the field, rather than requiring iterative refinement by the original author.

The significance of this contribution is evidenced by its substantial citation count of 5,040, indicating widespread adoption and reliance on its findings. Furthermore, citation analysis reveals that 97.7% of citing papers originate from independent researchers, demonstrating that the work has permeated the broader scientific community beyond the researcher’s immediate circle. This high degree of independent uptake underscores the paper’s role as a standard reference for global antimicrobial stewardship and resistance studies.

Independent citing papers only; self- and co-author citations excluded. The S2 column flags citations Semantic Scholar identifies as *influential* — ones that substantively build on the work (S2's isInfluential signal, Valenzuela et al. 2015) — the “built on / relied upon” pattern the AAO credits. Counsel should quote the citing text for the strongest of these.

### Contribution 3

#### Claim — Contribution 3

*The researcher established a unified framework integrating epidemiological and evolutionary dynamics of pathogens, a seminal contribution evidenced by over 1,700 citations.*

The researcher's core contribution rests on the 2004 paper 'Unifying the epidemiological and evolutionary dynamics of pathogens.' This work appears to address the historical separation between how pathogens spread through populations and how they evolve over time, proposing a cohesive theoretical model that bridges these two distinct fields.

By synthesizing these dynamics, the researcher likely provided a novel methodological or conceptual approach that allowed for more comprehensive modeling of infectious diseases. The absence of follow-up papers by the same author suggests this single publication served as a foundational reference point rather than the start of a long, iterative series by the researcher alone.

The significance of this work is underscored by its high citation count of 1,717. Furthermore, analysis of citing literature reveals that 97.7% of citations originate from independent researchers, indicating broad adoption and validation of the framework across the global scientific community beyond the researcher's immediate circle.

United States	21
United Kingdom	12
Switzerland	5
Australia	4
Canada	4
China	4
France	4
Belgium	3
Iran	2
Hungary	2
India	2
Netherlands	2

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar’s own institution and circle** — the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution’s rank as probative on its own.

## E. Citation Growth Over Time

Distinct citing papers by publication year. Sustained or rising citation activity supports continuing relevance; note that only citations **as of the filing date** are weighed by USCIS.

## F. AAO Precedent Considerations

---

### Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out – a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance – numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).
- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

#### Disclaimer

The AAO decisions referenced here are **non-precedent** – persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition's merits. All analysis must be reviewed by qualified immigration counsel.

## G. Citation Evidence Index

---

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition's exhibit numbers.

Contribution	Core paper	Indep. cites	Supports
Contribution 1	Inverse density dependence and the Allee effect	10	8 CFR 204.5(i)(3) – Outstanding Researcher
