

Citation Evidence Report

EB-1B Petition — Outstanding Professor or Researcher

8 CFR § 204.5(i)(3) · Authorship + Original Contributions

Charles S. Carver

University of Miami

[Google Scholar profile](#)

Generated 2026-05-21 by CiteMap. This report organises Google Scholar citation data into the structure USCIS adjudicators apply to the 8 CFR § 204.5(i)(3) outstanding-researcher criteria — particularly (iii) published material and (v) original scientific or scholarly contributions. It is a drafting aid for the petitioner’s counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

A. Overview & Filtering Statement

Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

Known limitations – counsel must verify. (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

97.8% independent of 46 classified citing papers

Citation type	Count
Independent	45
Self-citation	0
Co-author	1
Same-institution	0

0 citing papers could not be classified (no author data) and are excluded from the percentages above.

C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

Contribution 1

Claim – Contribution 1

The researcher established the theoretical and psychometric foundations for measuring generalized outcome expectancies, distinguishing optimism from related constructs to clarify its role in health psychology.

The researcher's contribution centers on defining and validating the construct of optimism within health psychology. This line of work is anchored by a seminal 1985 paper in Health Psychology that assessed generalized outcome expectancies and their implications for health, establishing a foundational framework for the field.

Originality in this work appears to lie in the rigorous differentiation of optimism from other psychological traits. A follow-up study published in 1994 in the Journal of Personality and Social Psychology suggests the researcher addressed critical methodological gaps by reevaluating measurement tools to distinguish optimism from neuroticism, trait anxiety, self-mastery, and self-esteem. This chronological progression indicates a sustained effort to refine the conceptual clarity and measurement validity of the construct.

The significance of this research is evidenced by its extensive uptake in the scientific community. The core 1985 paper has accumulated over 11,000 citations, while the 1994 follow-up has garnered more than 11,000 citations as well. Furthermore, analysis of citing literature reveals that 100% of the classified citations originate from independent researchers, indicating that this work has served as a widely adopted standard for scholars outside the researcher's immediate circle.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 21

CORE PAPER

[Optimism, Coping, and Health: Assessment and Implications of Generalized Outcome Expectancies](#)

1985 · Health Psychology · 11,843 citations (GS)

Field-normalised: 6,939 Semantic Scholar citations place it in the top 1% of Psychology papers from 1985 indexed by Semantic Scholar, by citation count.

No.	Citing paper	Citing institution(s)	Country	S2

Counsel should quote the citing text for the strongest of these.

Contribution 2

Claim – Contribution 2

The researcher developed a theoretically grounded framework for assessing coping strategies, establishing a seminal standard in personality and social psychology.

The researcher’s primary contribution is the development of a theoretically based approach to assessing coping strategies, as detailed in their 1989 paper published in the Journal of Personality and Social Psychology. This work stands as a foundational piece in the field, with no subsequent follow-up papers by the same author listed in this specific line of inquiry, suggesting the core framework itself constitutes the complete contribution.

This line of work appears to address the need for rigorous, theory-driven methods in evaluating how individuals manage stress. By grounding the assessment in established theory rather than ad-hoc measures, the researcher likely provided a more coherent and valid tool for psychological research, distinguishing this approach from earlier, less structured methodologies.

The significance of this contribution is evidenced by its substantial citation count of over 22,000, indicating widespread adoption and influence. Furthermore, analysis of citing literature reveals that 100% of the classified citations originate from independent researchers, demonstrating that the framework has been embraced and utilized by the broader scientific community beyond the researcher’s immediate circle.

Counsel should quote the citing text for the strongest of these.

Contribution 3

Claim – Contribution 3

The researcher developed the BIS/BAS scales, a seminal framework for measuring behavioral inhibition and activation systems in response to reward and punishment.

The researcher’s primary contribution is the development of the Behavioral Inhibition System/Behavioral Activation System (BIS/BAS) scales, introduced in a 1994 paper published in the Journal of Personality and Social Psychology. This work provides a structured method for assessing affective responses to impending reward and punishment, establishing a foundational tool for personality and social psychology research.

This line of work appears to address the need for precise, quantifiable measures of motivational systems. By distinguishing between behavioral inhibition and activation, the researcher offered a novel way to operationalize complex affective responses. The titles suggest a focus on the interplay between these systems and their impact on emotional reactions, filling a gap in how researchers measure individual differences in sensitivity to reward and punishment.

The significance of this contribution is evidenced by its extensive uptake in the scientific community. With over 11,000 citations, the work has become a standard reference in the field. Notably, analysis of citing papers reveals that 100% of the classified citations come from independent researchers, indicating that the BIS/BAS scales have been widely adopted and utilized by scholars outside the researcher’s immediate circle, underscoring the tool’s broad utility and impact.

Spain	1
United Arab Emirates	1
Italy	1

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar's own institution and circle** — the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution's rank as probative on its own.

E. Citation Growth Over Time

Distinct citing papers by publication year. Sustained or rising citation activity supports continuing relevance; note that only citations **as of the filing date** are weighed by USCIS.

F. AAO Precedent Considerations

Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out – a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance – numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).
- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

Disclaimer

The AAO decisions referenced here are **non-precedent** – persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition's merits. All analysis must be reviewed by qualified immigration counsel.

G. Citation Evidence Index

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition's exhibit numbers.

Contribution	Core paper	Indep. cites	Supports
Contribution 1	Optimism, Coping, and Health: Assessment and Implications of Generalized Outcome Expectancies	21	8 CFR 204.5(i)(3) – Outstanding Researcher
