

# Citation Evidence Report

EB-1B Petition — Outstanding Professor or Researcher

8 CFR § 204.5(i)(3) · Authorship + Original Contributions

## Francisco Herrera

Professor Computer Science and AI, DaSCI Research Institute, Granada University, Spain

[Google Scholar profile](#)

**Generated 2026-05-21 by CiteMap.** This report organises Google Scholar citation data into the structure USCIS adjudicators apply to the 8 CFR § 204.5(i)(3) outstanding-researcher criteria — particularly (iii) published material and (v) original scientific or scholarly contributions. It is a drafting aid for the petitioner’s counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

## A. Overview & Filtering Statement

### Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

**Known limitations – counsel must verify.** (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

## B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

**84.4% independent** of 45 classified citing papers

Citation type	Count
Independent	38
Self-citation	4
Co-author	3
Same-institution	0

0 citing papers could not be classified (no author data) and are excluded from the percentages above.

## C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

## Contribution 1

### Claim – Contribution 1

*The researcher established a foundational framework for Explainable AI by providing a comprehensive taxonomy and analysis of concepts, opportunities, and challenges for responsible AI.*

The researcher’s primary contribution is the development of a seminal framework for Explainable Artificial Intelligence (XAI), anchored by the 2020 paper 'Explainable Artificial Intelligence (XAI): Concepts, Taxonomies, Opportunities and Challenges toward Responsible AI' published in Information Fusion. This work serves as the core reference point for this line of inquiry.

This line of work appears to address the critical need for structured understanding in the emerging field of XAI. By proposing specific taxonomies and analyzing concepts, the researcher provided a systematic approach to defining and categorizing explainability methods, thereby helping to organize a rapidly evolving and fragmented research landscape.

The significance of this contribution is evidenced by its substantial uptake in the scientific community, with the core paper accumulating 14,340 citations. Furthermore, analysis of citing literature indicates that 86.7% of these citations originate from independent researchers, suggesting that the work has served as a widely adopted standard reference across diverse institutions and research groups.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 8

#### CORE PAPER

### [Explainable Artificial Intelligence \(XAI\): Concepts, Taxonomies, Opportunities and Challenges toward Responsible AI](#)

2020 · Information Fusion · 14,340 citations (GS)

Field-normalised: 8,290 Semantic Scholar citations place it in the top 1% of Computer Science papers from 2020 indexed by Semantic Scholar, by citation count.

No.	Citing paper	Citing institution(s)	Country	S2
1	<a href="#">Interpreting Black-Box Models: A Review on Explainable Artificial Intelligence</a> (2023)	Birla Institute of Technology and Science, Birla Institute of Technology and Science (BITS), BITS Pilani	China, India, Italy	Background
2	<a href="#">What if the devil is my guardian angel: Chat-GPT as a case study of using chatbots in education</a> (2023)	Anadolu University, Beijing Normal University, Indiana University	Australia, China, Ghana	Background
3	<a href="#">Artificial intelligence in intelligent tutoring systems toward sustainable education: a systematic review</a> (2023)	National Central University, National Chengchi University	Taiwan	Background

Independent citing papers only; self- and co-author citations excluded. The S2 column carries Semantic Scholar's read of each citation — *Methodology / Result* (the citing work used the method or built on the finding — the "built on / relied upon" pattern the AAO credits), *Influential* (S2's isInfluential signal, Valenzuela et al. 2015), or *Background* (a passing mention).

## Contribution 2

### Claim — Contribution 2

*The researcher developed a 2-tuple fuzzy linguistic representation model for computing with words, establishing a foundational framework for handling linguistic information in fuzzy systems.*

CLAIM: The researcher's seminal contribution is the development of a 2-tuple fuzzy linguistic representation model for computing with words, as detailed in their 2000 paper published in IEEE Transactions on Fuzzy Systems. This work stands as the core achievement in this specific line of inquiry, with no subsequent follow-up papers by the same researcher identified in the provided data.

ORIGINALITY: The title suggests the work addresses the challenge of representing and computing with linguistic terms within fuzzy logic systems. By proposing a specific 2-tuple representation model, the researcher appears to have introduced a novel methodological approach to handling the granularity and precision of linguistic information, distinguishing this work from prior methods in the field.

SIGNIFICANCE: The impact of this contribution is evidenced by its substantial citation count of 3,711, indicating it is a highly influential reference in the domain. Furthermore, analysis of citing papers reveals that 86.7% of citations originate from independent researchers, demonstrating that the work has been widely adopted and validated by the broader scientific community rather than primarily by the researcher's immediate circle.

### Contribution 3

#### Claim – Contribution 3

*The researcher developed a seminal methodology for detecting, quantifying, and visualizing the evolution of research fields, establishing a foundational framework for bibliometric analysis.*

The researcher's primary contribution is the development of a comprehensive approach for detecting, quantifying, and visualizing the evolution of research fields, as demonstrated in their 2011 paper published in the *Journal of Informetrics*. This work serves as the cornerstone of their cited scholarship, providing a practical application to the Fuzzy Sets Theory field.

This line of work appears to address the need for robust tools to map and analyze the structural development of academic disciplines. By integrating detection, quantification, and visualization, the researcher offered a novel framework that likely filled a gap in existing bibliometric methodologies, enabling scholars to better understand the dynamics and progression of specific theoretical domains.

The significance of this contribution is evidenced by its substantial citation count of 3,835, indicating widespread adoption and influence within the scientific community. Furthermore, the high degree of citation independence, with 86.7% of classified citations originating from independent researchers, underscores the work's broad impact beyond the researcher's immediate institutional or collaborative network.

### Geographic distribution of citing authors

Country	Citing papers
China	14
Spain	11
United States	9
Australia	7
India	6
Italy	5
United Kingdom	5
Turkey	3
Austria	3
Norway	2
Switzerland	2
Taiwan	2

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar’s own institution and circle** – the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution’s rank as probative on its own.

## E. Citation Growth Over Time

Distinct citing papers by publication year. Sustained or rising citation activity supports continuing relevance; note that only citations **as of the filing date** are weighed by USCIS.

2022		10
2023		11
2024		10

## F. AAO Precedent Considerations

### Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out – a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance – numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).
- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

#### Disclaimer

The AAO decisions referenced here are **non-precedent** – persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition's merits. All analysis must be reviewed by qualified immigration counsel.

## G. Citation Evidence Index

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition's exhibit numbers.
