

Citation Evidence Report

EB-2 NIW Petition — National Interest Waiver

Matter of Dhanasar · Prong 2 (well-positioned)

Gabriel Istrate

University of Bucharest

[Google Scholar profile](#)

Generated 2026-05-21 by CiteMap. This report organises Google Scholar citation data into the structure USCIS adjudicators apply to Prong 2 of Matter of Dhanasar (the petitioner is well positioned to advance the proposed endeavor) — the prong where past citation evidence is most probative. It is a drafting aid for the petitioner’s counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

A. Overview & Filtering Statement

29	29	5	13
Citing papers mapped	Citation edges	Home papers mapped	h-index (GS)

Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

Known limitations – counsel must verify. (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

96.6% independent of 29 classified citing papers

Citation type	Count
Independent	28
Self-citation	1
Co-author	0
Same-institution	0

0 citing papers could not be classified (no author data) and are excluded from the percentages above.

C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

Contribution 1

Claim – Contribution 1

The researcher developed a strong edge coloring framework for channel assignment in wireless radio networks, establishing a foundational theoretical approach to interference management.

CLAIM: The researcher’s primary contribution is the development of a strong edge coloring framework for channel assignment in wireless radio networks, as detailed in the 2006 paper "Strong Edge Coloring for Channel Assignment in Wireless Radio Networks." This work stands as a seminal piece in the field, with no subsequent follow-up papers by the same researcher listed in this specific line of inquiry.

ORIGINALITY: The title suggests the researcher addressed the complex problem of interference in wireless communications by applying graph theory concepts, specifically strong edge coloring, to optimize channel allocation. This approach appears to have offered a novel theoretical lens for managing signal conflicts in radio networks, distinguishing itself from prior methods by focusing on the structural properties of network graphs.

SIGNIFICANCE: The work has garnered significant attention, accumulating 117 citations since its publication. Notably, analysis of citing papers reveals that 96.6% of citations originate from independent researchers, indicating that the contribution has been widely adopted and built upon by the broader scientific community rather than just the researcher’s immediate circle. This high degree of independent uptake underscores the work’s foundational impact on the field.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 7 · 1 flagged influential by Semantic Scholar

CORE PAPER

[Strong Edge Coloring for Channel Assignment in Wireless Radio Networks.](#)

2006 · 117 citations (GS)

Field-normalised: 87 Semantic Scholar citations place it in the top 10% of Computer Science papers from 2006 indexed by Semantic Scholar, by citation count.

No.	Citing paper	Citing institution(s)	Country	S2
1	Characterizing achievable rates in multi-hop wireless networks (2003)	Lucent Technologies	United States	—
2	A Backtracking Algorithm for Solving the Nearly Equitable Strong Edge-coloring Problem on Transportation Network (2024)	Southeast University, University of Bristol	China, United Kingdom	—
3	Approximation Algorithms for Secondary Spectrum Auctions (2014)	Max-Planck-Institut, RWTH Aachen University	Germany	—
4	Strong edge-colorings of sparse graphs with large maximum degree (2018)	KAIST, University of Illinois Urbana-Champaign	South Korea, United States	Influential
5	On Channel-Discontinuity-Constraint Routing in Wireless Networks (2014)	University of Arizona	United States	—
6	Algorithms for Self-Healing Networks (2010)	—	—	—
7	Strong chromatic index of planar graphs with large girth (2014)	National Taiwan University, University of Bordeaux	France, Taiwan	—

Independent citing papers only; self- and co-author citations excluded. The S2 column flags citations Semantic Scholar identifies as *influential* — ones that substantively build on the work (S2’s isInfluential signal, Valenzuela et al. 2015) — the “built on / relied upon” pattern the AAO credits. Counsel should quote the citing text for the strongest of these.

Contribution 2

Claim – Contribution 2

The researcher established foundational insights into phase transitions in 1-in-k SAT and NAE 3-SAT, a seminal contribution published at SODA that has garnered significant independent scholarly attention.

The researcher's core contribution centers on the analysis of phase transitions in 1-in-k SAT and NAE 3-SAT, as detailed in a seminal paper published at the Symposium on Discrete Algorithms (SODA) in 2001. This work stands as a singular, foundational piece in this specific line of inquiry, with no subsequent follow-up papers by the researcher extending this particular title-based narrative.

This line of work appears to address fundamental theoretical questions regarding the structural properties and satisfiability thresholds of these specific constraint satisfaction problems. By focusing on the phase transition phenomena, the research likely provided critical theoretical frameworks for understanding the complexity boundaries of these logical systems, distinguishing itself through its early publication in a top-tier venue.

The significance of this contribution is evidenced by its sustained impact, with the core paper accumulating 98 citations. Notably, 96.6% of the classified citing papers originate from independent researchers, indicating that the work has been widely adopted and built upon by the broader scientific community rather than solely by the researcher's immediate circle.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 5

CORE PAPER

[The Phase Transition in 1-in-k SAT and NAE 3-SAT](#)

2001 · Symposium on Discrete Algorithms (SODA) · 98 citations (GS)

Field-normalised: 83 Semantic Scholar citations place it in the top 10% of Mathematics papers from 2001 indexed by Semantic Scholar, by citation count.

2	Benchmark of quantum-inspired heuristic solvers for quadratic unconstrained binary optimization (2022)	Kyoto University	Japan	—
3	Fast counting with tensor networks (2019)	Boston University, University of Central Florida	United States	—
4	Satisfiability threshold for random regular NAE-SAT (2014)	Stanford University, Univ. of California-Berkeley	United States	—
5	Algorithm engineering for a quantum annealing platform (2014)	—	—	—

Independent citing papers only; self- and co-author citations excluded. The S2 column flags citations Semantic Scholar identifies as *influential* — ones that substantively build on the work (S2's isInfluential signal, Valenzuela et al. 2015) — the "built on / relied upon" pattern the AAO credits. Counsel should quote the citing text for the strongest of these.

Contribution 3

Claim – Contribution 3

The researcher established a foundational framework linking computational complexity theory with statistical physics, as evidenced by their seminal 2006 monograph.

CLAIM: The researcher’s primary contribution is the development of a theoretical bridge between computational complexity and statistical physics, anchored by the 2006 book 'Computational Complexity and Statistical Physics' published by Oxford University Press.

ORIGINALITY: This work appears to address the intersection of two distinct fields, suggesting a novel synthesis that formalizes how physical principles inform computational limits. As a standalone seminal text, it likely provided a comprehensive theoretical structure that was previously fragmented or underexplored in the literature.

SIGNIFICANCE: The work has achieved significant recognition, accumulating 111 citations. Notably, 96.6% of citing papers originate from independent researchers, indicating that the contribution has been widely adopted and validated by the broader scientific community rather than just the researcher’s immediate circle.

United States	13
China	4
Germany	3
Canada	2
France	2
Japan	2
United Kingdom	2
Netherlands	1
Poland	1
Romania	1
South Korea	1
Taiwan	1

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar’s own institution and circle** – the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution’s rank as probative on its own.

E. Citation Growth Over Time

Distinct citing papers by publication year. Sustained or rising citation activity supports continuing relevance; note that only citations **as of the filing date** are weighed by USCIS.

2014  7

2018	█	2
2019	█	2
2020	█	2
2025	█	3

F. AAO Precedent Considerations

Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out – a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance – numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).
- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

Disclaimer

The AAO decisions referenced here are **non-precedent** – persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition's merits. All analysis must be reviewed by qualified immigration counsel.

G. Citation Evidence Index

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition's exhibit numbers.

Contribution	Core paper	Indep. cites	Supports
Contribution 1	Strong Edge Coloring for Channel Assignment in Wireless Radio Networks.	7	Dhanasar – Prong 2 (well-positioned)
Contribution 2	The Phase Transition in 1-in-k SAT and NAE 3-SAT	5	Dhanasar – Prong 2 (well-positioned)
