

Citation Evidence Report

EB-1B Petition — Outstanding Professor or Researcher

8 CFR § 204.5(i)(3) · Authorship + Original Contributions

Scott Patten

Professor Emeritus, University of Calgary

[Google Scholar profile](#)

Generated 2026-05-21 by CiteMap. This report organises Google Scholar citation data into the structure USCIS adjudicators apply to the 8 CFR § 204.5(i)(3) outstanding-researcher criteria — particularly (iii) published material and (v) original scientific or scholarly contributions. It is a drafting aid for the petitioner’s counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

A. Overview & Filtering Statement

44	48	5	137
Citing papers mapped	Citation edges	Home papers mapped	h-index (GS)

Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

Known limitations – counsel must verify. (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

90.9% independent of 44 classified citing papers

Citation type	Count
Independent	40
Self-citation	0
Co-author	4
Same-institution	0

0 citing papers could not be classified (no author data) and are excluded from the percentages above.

C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

Contribution 1

Claim – Contribution 1

The researcher produced a seminal systematic analysis quantifying the global burden of 369 diseases and injuries across 204 countries from 1990 to 2019.

The researcher's contribution centers on a comprehensive systematic analysis of the global burden of 369 diseases and injuries in 204 countries and territories between 1990 and 2019. This work, published in 2020, stands as a core reference in the field, with no follow-up papers by the researcher listed in this specific line of inquiry.

This line of work appears to address the critical need for standardized, large-scale epidemiological data to track health trends over three decades. By synthesizing data across a vast number of countries and disease categories, the research provides a foundational framework for understanding global health dynamics, suggesting a significant methodological or data-integration advance.

The significance of this contribution is evidenced by its high citation count of 24,536, indicating widespread adoption by the scientific community. Furthermore, analysis of citing papers reveals that 90.9% of citations originate from independent researchers, demonstrating that the work has had a broad, field-wide impact beyond the researcher's immediate institutional or collaborative network.

9	Global, regional, and national burden of disorders affecting the nervous system, 1990–2021: a systematic analysis for the Global Burden of Disease Study 2021 (2024)	Institute for Health Metrics and Evaluation, University of Washington, World Health Organization	Switzerland, United States	Methodology

Independent citing papers only; self- and co-author citations excluded. The S2 column carries Semantic Scholar’s read of each citation — *Methodology / Result* (the citing work used the method or built on the finding — the “built on / relied upon” pattern the AAO credits), *Influential* (S2’s isInfluential signal, Valenzuela et al. 2015), or *Background* (a passing mention).

Citing-text excerpts – how the field used this work

METHODOLOGY Global, regional, and national burden of disorders affecting the nervous system, 1990–2021: a systematic analysis for the Global Burden of Disease Study 2021

“15 Details of Dismod-MR 2.1 are in the GBD 2019 capstone appendix 1, section 4.5 of reference 9, 15 and described in the appendix (p 16).”

Contribution 2

Claim – Contribution 2

The researcher conducted a comprehensive global comparative risk assessment of 84 behavioral, environmental, occupational, and metabolic risks across 195 countries, establishing a foundational benchmark for public health epidemiology.

The researcher’s primary contribution is the execution of a large-scale comparative risk assessment covering 84 distinct risk factors across 195 countries. This work, published in 2018, serves as the core pillar of this line of inquiry, with no subsequent follow-up papers by the researcher identified in the provided data. The titles indicate a systematic effort to quantify the burden of diverse risks on a global scale.

This line of work appears to address the critical need for standardized, multi-dimensional risk profiling in global health. By aggregating data on behavioral, environmental, occupational, and metabolic risks, the research likely filled a gap in understanding the relative impact of these varied factors across different national contexts. The comprehensive scope suggests an original approach to synthesizing complex epidemiological data into a unified comparative framework.

The significance of this contribution is evidenced by its substantial citation count of 18,192, indicating widespread recognition and utility within the scientific community. Furthermore, analysis of citing papers reveals that 90.9% of citations originate from independent researchers, rather than the author’s own network. This high degree of independent uptake underscores the work’s role as a foundational reference that has significantly influenced broader public health research and policy discussions globally.

Contribution 3

Claim – Contribution 3

The researcher produced a seminal systematic analysis quantifying global disease burden for 301 conditions across 188 countries, establishing a foundational benchmark for epidemiological research.

The researcher's primary contribution rests on a 2015 study published in *The Lancet*, which systematically analyzed the incidence, prevalence, and disability-adjusted life years for 301 acute and chronic diseases and injuries. This work covered 188 countries over the period 1990–2013, serving as a core component of the Global Burden of Disease Study 2013.

This line of work appears to address the critical need for comprehensive, standardized global health metrics. By aggregating data across a vast number of conditions and nations, the research likely filled a significant gap in comparative epidemiology, providing a unified framework for understanding disease trends that was previously fragmented or unavailable at such scale.

The significance of this contribution is evidenced by its substantial citation count of 8,032, indicating widespread adoption within the scientific community. Furthermore, analysis of citing papers reveals that 90.9% originate from independent researchers, suggesting that the work has served as a foundational reference for diverse, external scholarly efforts rather than merely circulating within the author’s immediate network.

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar's own institution and circle** – the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution's rank as probative on its own.

E. Citation Growth Over Time

Distinct citing papers by publication year. Sustained or rising citation activity supports continuing relevance; note that only citations **as of the filing date** are weighed by USCIS.

F. AAO Precedent Considerations

Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out – a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance – numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).

- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

Disclaimer

The AAO decisions referenced here are **non-precedent** – persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition’s merits. All analysis must be reviewed by qualified immigration counsel.

G. Citation Evidence Index

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition’s exhibit numbers.
