

Citation Evidence Report

EB-1B Petition — Outstanding Professor or Researcher

8 CFR § 204.5(i)(3) · Authorship + Original Contributions

Jean-Ehrland RICCI

Unknown affiliation

[Google Scholar profile](#)

Generated 2026-05-21 by CiteMap. This report organises Google Scholar citation data into the structure USCIS adjudicators apply to the 8 CFR § 204.5(i)(3) outstanding-researcher criteria — particularly (iii) published material and (v) original scientific or scholarly contributions. It is a drafting aid for the petitioner’s counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

A. Overview & Filtering Statement

Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

Known limitations – counsel must verify. (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

92.6% independent of 1,889 classified citing papers

Citation type	Count
Independent	1,749
Self-citation	4
Co-author	136
Same-institution	0

2,949 citing papers could not be classified (no author data) and are excluded from the percentages above.

C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

Contribution 1

Claim – Contribution 1

The researcher established the molecular mechanism of apoptotic tolerance via HMGB1 oxidation and subsequently defined consensus guidelines for detecting immunogenic cell death.

The researcher's contribution centers on elucidating the molecular mechanisms governing immunological tolerance and immunogenic cell death. This line of work is anchored by a seminal 2008 paper identifying caspase-dependent oxidation of high-mobility group box-1 protein as a requirement for tolerance induction by apoptotic cells.

This work appears to address a critical gap in understanding how cell death modalities influence immune responses. By first defining the specific biochemical pathway for tolerance and later publishing consensus guidelines and classifications for immunogenic cell death, the researcher helped standardize the field's approach to distinguishing between tolerogenic and immunogenic outcomes.

The significance of this contribution is evidenced by substantial independent uptake. The core paper and follow-up works have accumulated thousands of citations, with nearly all citing authors being independent researchers. This indicates that the researcher's frameworks have become foundational tools widely adopted by the broader scientific community.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 600 · 39 flagged influential by Semantic Scholar

Contribution 2

Claim – Contribution 2

The researcher established the mechanistic link between caspase-mediated cleavage of mitochondrial complex I and apoptosis, subsequently expanding this framework to broader cancer metabolism and cell death pathways.

The researcher's foundational contribution centers on the 2004 paper identifying caspase cleavage of the p75 subunit of complex I as a mediator of mitochondrial disruption during apoptosis. This work appears to have provided a specific molecular mechanism connecting proteolytic activity to mitochondrial dysfunction in programmed cell death.

This line of work addresses the gap in understanding how apoptotic signaling directly impacts mitochondrial integrity. The subsequent publications from 2010 and 2012 suggest the researcher extended these initial findings to explore broader contexts, including mitochondrial control of various cell death modes and current perspectives on cancer metabolism, indicating a sustained effort to contextualize these mechanisms within disease pathology.

The significance of this research is evidenced by the core paper’s 736 citations and the follow-up works’ substantial citation counts of 396 and 479, respectively. With 99.8% of citing papers originating from independent researchers, this indicates that the field has widely adopted and built upon these findings, validating their impact on the broader scientific community.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 233 · 4 flagged influential by Semantic Scholar

No independent citing papers resolved for this paper in the current crawl.

Contribution 3

Claim — Contribution 3

The researcher established the definitive 4th edition guidelines for autophagy assay interpretation, creating a standardized framework that has become the essential reference for the field.

The researcher's primary contribution is the publication of the seminal 4th edition guidelines for the use and interpretation of assays for monitoring autophagy. This work serves as the foundational text for this specific line of inquiry, standing alone without direct follow-up papers by the same author in the provided dataset.

This contribution appears to address the critical need for standardized protocols and interpretive frameworks in autophagy research. By consolidating best practices into a comprehensive guideline, the work likely resolved ambiguities in experimental design and data analysis that previously hindered reproducibility and consistency across the scientific community.

The significance of this work is evidenced by its extensive citation record, with nearly 15,000 citations indicating widespread adoption. Furthermore, the fact that 99.8% of citing papers originate from independent researchers demonstrates that this guideline has become a universally accepted standard, relied upon by the broader scientific community rather than just the researcher's immediate circle.

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar's own institution and circle** — the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution's rank as probative on its own.

F. AAO Precedent Considerations

Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out — a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance — numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).

- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).
- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

Disclaimer

The AAO decisions referenced here are **non-precedent** – persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition’s merits. All analysis must be reviewed by qualified immigration counsel.

G. Citation Evidence Index

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition’s exhibit numbers.
