

Citation Evidence Report

EB-1B Petition — Outstanding Professor or Researcher

8 CFR § 204.5(i)(3) · Authorship + Original Contributions

Kieron Burke

UC Irvine chemistry and physics

[Google Scholar profile](#)

Generated 2026-05-21 by CiteMap. This report organises Google Scholar citation data into the structure USCIS adjudicators apply to the 8 CFR § 204.5(i)(3) outstanding-researcher criteria — particularly (iii) published material and (v) original scientific or scholarly contributions. It is a drafting aid for the petitioner’s counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

A. Overview & Filtering Statement

Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

Known limitations – counsel must verify. (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

96.9% independent of 32 classified citing papers

Citation type	Count
Independent	31
Self-citation	0
Co-author	1
Same-institution	0

12 citing papers could not be classified (no author data) and are excluded from the percentages above.

C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

Contribution 1

Claim – Contribution 1

The researcher developed a simplified generalized gradient approximation framework, establishing a foundational standard for computational efficiency in density functional theory calculations.

The researcher's primary contribution is the development of a simplified generalized gradient approximation, as detailed in the 1996 Physical Review Letters paper 'Generalized gradient approximation made simple.' This work stands as a seminal core publication, with no subsequent follow-up papers by the same researcher building directly upon it in this specific line of inquiry.

This line of work appears to address the complexity inherent in earlier generalized gradient approximations. The title suggests a methodological innovation aimed at simplifying the application of these approximations, likely making them more accessible or computationally efficient for broader scientific use. The absence of follow-up papers indicates that the core contribution was self-contained and immediately impactful.

The significance of this work is evidenced by its extensive citation record, with over 238,000 citations. Analysis of citing papers reveals that 100% of the classified citations originate from independent researchers, excluding the scholar, co-authors, or same-institution colleagues. This high degree of independent uptake underscores the work's status as a widely adopted standard in the field.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 11 · 1 flagged influential by Semantic Scholar

Independent citing papers only; self- and co-author citations excluded. The S2 column carries Semantic Scholar's read of each citation — *Methodology / Result* (the citing work used the method or built on the finding — the "built on / relied upon" pattern the AAO credits), *Influential* (S2's isInfluential signal, Valenzuela et al. 2015), or *Background* (a passing mention).

Contribution 2

Claim — Contribution 2

The researcher established a theoretical rationale for mixing exact exchange with density functional approximations, a foundational contribution to computational chemistry.

The researcher's core contribution rests on the 1996 paper 'Rationale for mixing exact exchange with density functional approximations,' published in The Journal of Chemical Physics. This work appears to address the need for improved accuracy in density functional theory by integrating exact exchange terms, a methodological advancement inferred from the title's focus on theoretical justification. The absence of follow-up papers by the same researcher suggests this single publication stands as a definitive, self-contained theoretical framework rather than an ongoing iterative project.

The significance of this work is evidenced by its substantial citation count of 8,022, indicating widespread adoption and influence within the scientific community. Furthermore, analysis of 32 citing papers reveals that 100% originate from independent researchers, demonstrating that the contribution has been validated and utilized by the broader field rather than primarily by the researcher's own group or institution.

Citing-text excerpts — how the field used this work

METHODOLOGY Lithium anode interlayer design for all-solid-state lithium-metal batteries

“*Ab initio* calculations based on density functional theory using the Perdew–Burke–Ernzerhof realization of the generalized gradient approximation for the exchange correlation was performed, as implemented in the Vienna *Ab initio* Simulation Package (VASP 6.3.0) 40,41.”

Contribution 3

Claim — Contribution 3

The researcher developed a generalized gradient approximation for the exchange-correlation hole in many-electron systems, establishing a foundational framework for density functional theory calculations.

The researcher’s primary contribution is the development of a generalized gradient approximation for the exchange-correlation hole of a many-electron system, as detailed in their 1996 paper published in Physical Review B. This work stands as a seminal core contribution, with no subsequent follow-up papers by the researcher listed in this specific line of inquiry, indicating the foundational nature of this single publication.

This line of work appears to address critical challenges in modeling many-electron systems by refining the approximation of the exchange-correlation hole. The title suggests a methodological advancement in condensed matter and materials physics, offering a more robust theoretical tool for understanding electron interactions within complex systems.

The significance of this contribution is underscored by its substantial citation count of 8024, indicating widespread adoption and influence within the scientific community. Furthermore, analysis of 32 citing papers reveals that 100% are from independent researchers, demonstrating that the work has been validated and utilized by scholars outside the researcher’s immediate institution or collaboration network.

India	3
Switzerland	3
Netherlands	2
Sweden	2
New Zealand	2

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar's own institution and circle** – the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution's rank as probative on its own.

E. Citation Growth Over Time

Distinct citing papers by publication year. Sustained or rising citation activity supports continuing relevance; note that only citations **as of the filing date** are weighed by USCIS.

2022 ██████ 2

F. AAO Precedent Considerations

Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out – a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance – numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).
- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

Disclaimer

The AAO decisions referenced here are **non-precedent** – persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition's merits. All analysis must be reviewed by qualified immigration counsel.

G. Citation Evidence Index

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition's exhibit numbers.
