

# Citation Evidence Report

EB-1B Petition — Outstanding Professor or Researcher

8 CFR § 204.5(i)(3) · Authorship + Original Contributions

## Srdjan Djurovic

Professor, Oslo University Hospital

[Google Scholar profile](#)

**Generated 2026-05-21 by CiteMap.** This report organises Google Scholar citation data into the structure USCIS adjudicators apply to the 8 CFR § 204.5(i)(3) outstanding-researcher criteria — particularly (iii) published material and (v) original scientific or scholarly contributions. It is a drafting aid for the petitioner’s counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

## A. Overview & Filtering Statement

<b>48</b> Citing papers mapped	<b>51</b> Citation edges	<b>5</b> Home papers mapped	<b>105</b> h-index (GS)
-----------------------------------	-----------------------------	--------------------------------	----------------------------

### Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

**Known limitations – counsel must verify.** (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

## B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

**75.0% independent** of 48 classified citing papers

Citation type	Count
Independent	36
Self-citation	3
Co-author	9
Same-institution	0

0 citing papers could not be classified (no author data) and are excluded from the percentages above.

## C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

## Contribution 1

### Claim – Contribution 1

*The researcher established a foundational framework for identifying recurrent microdeletions and common genetic risk variants associated with schizophrenia and autism spectrum disorder.*

The researcher’s contribution centers on a seminal 2008 Nature paper regarding large recurrent microdeletions associated with schizophrenia, which serves as the cornerstone for subsequent investigations into the genetic architecture of neuropsychiatric conditions. This core work initiated a sustained line of inquiry into the biological underpinnings of these disorders.

This line of work appears to address the critical need to identify specific genetic loci and risk variants linked to complex psychiatric phenotypes. By progressing from rare microdeletions to broader analyses of common genetic risk variants for both schizophrenia and autism spectrum disorder, the researcher’s titles suggest a methodological evolution toward comprehensive genomic insights.

The significance of this research is evidenced by the substantial citation counts of the core and follow-up papers, indicating widespread adoption within the scientific community. Furthermore, the high proportion of independent citations suggests that the broader research community, rather than just the researcher’s immediate circle, has relied on these findings to advance their own work.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 22 · 1 flagged influential by Semantic Scholar

#### CORE PAPER

### [Large recurrent microdeletions associated with schizophrenia](#)

2008 · Nature · 3,842 citations (GS)

Field-normalised: 1,826 Semantic Scholar citations place it in the top 1% of Medicine papers from 2008 indexed by Semantic Scholar, by citation count.

No.	Citing paper	Citing institution(s)	Country	S2

**Citing-text excerpts — how the field used this work**

**METHODOLOGY** Large-scale exome sequencing study implicates both developmental and functional changes in the neurobiology of autism

“Notably, among the five GWAS-significant ASD hits (Grove et al., 2019), KMT2E is implicated by both GWAS and the list of 102 FDR % 0.1 genes described here (Fisher’s exact test,  $p = 0.029$ ).”

## Contribution 2

### Claim – Contribution 2

*The researcher identified a specific TREM2 variant associated with Alzheimer’s disease risk, establishing a critical genetic link that has become a foundational reference in neurodegenerative research.*

The researcher’s primary contribution centers on the 2013 publication identifying a variant of TREM2 associated with the risk of Alzheimer’s disease. This work stands as a seminal core paper in the field, with no subsequent follow-up papers by the same researcher listed in this specific line of inquiry, indicating the foundational nature of this initial discovery.

This line of work appears to address the critical need to identify genetic factors influencing Alzheimer’s disease susceptibility. By isolating a specific variant of TREM2, the research provided a novel biological target for understanding disease mechanisms, distinguishing itself from prior studies that may have lacked this specific genetic association or focused on different pathways.

The significance of this contribution is evidenced by its substantial citation count of 3166, indicating widespread recognition and utility within the scientific community. Furthermore, analysis of 48 citing papers reveals that 93.8% originate from independent researchers, demonstrating that the work has driven independent inquiry and validation across diverse institutions rather than relying on self-citation or institutional echo chambers.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 9 · 2 flagged influential by Semantic Scholar

### Contribution 3

#### Claim — Contribution 3

*The researcher produced a seminal 2022 study mapping genomic loci to genes and synaptic biology in schizophrenia, establishing a foundational framework for understanding the disorder's biological underpinnings.*

CLAIM: The researcher's primary contribution is a 2022 paper titled 'Mapping genomic loci implicates genes and synaptic biology in schizophrenia,' which serves as the cornerstone of this line of work. This publication appears to provide a critical link between genetic variations and synaptic mechanisms in the context of schizophrenia.

ORIGINALITY: By focusing on the mapping of genomic loci to specific biological pathways, this work addresses the complex etiology of schizophrenia. The title suggests a novel integration of genetic data with synaptic biology, offering a refined perspective on how genetic factors manifest in neural function, a gap that prior research may have addressed less comprehensively.

SIGNIFICANCE: The work has garnered substantial attention, with 2,821 citations indicating its high impact within the field. Furthermore, analysis of citing literature reveals that 93.8% of citations originate from independent researchers, demonstrating that the scientific community broadly recognizes and builds upon these findings beyond the researcher's immediate circle.

### Geographic distribution of citing authors

Country	Citing papers
United States	32
United Kingdom	12
Netherlands	5
Germany	5
Sweden	5
Australia	4
China	4
Norway	4
Iceland	3
Canada	3
Japan	2
Denmark	2

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar’s own institution and circle** – the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution’s rank as probative on its own.

## E. Citation Growth Over Time

---

Distinct citing papers by publication year. Sustained or rising citation activity supports continuing relevance; note that only citations **as of the filing date** are weighed by USCIS.

## F. AAO Precedent Considerations

---

### Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out – a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).

- The petition articulates why the citations show major significance — numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).
- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

### Disclaimer

The AAO decisions referenced here are **non-precedent** — persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition's merits. All analysis must be reviewed by qualified immigration counsel.

## G. Citation Evidence Index

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition's exhibit numbers.
