

Citation Evidence Report

EB-1A Petition — Original Contributions of Major Significance

8 CFR § 204.5(h)(3)(v) · Criterion 5

Chenghao Wang

University of Michigan, Ann Arbor

[Google Scholar profile](#)

Generated 2026-05-30 by CiteMap. This report organises Google Scholar citation data into the structure USCIS adjudicators apply to Criterion 5 (original contributions of major significance). It is a drafting aid for the petitioner's counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

A. Overview & Filtering Statement

Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

Known limitations – counsel must verify. (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

80.2% independent of 126 classified citing papers

Citation type	Count
Independent	101
Self-citation	4
Co-author	21
Same-institution	0

8 citing papers could not be classified (no author data) and are excluded from the percentages above.

C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

Contribution 1

Claim – Contribution 1

The researcher established a foundational framework for peristaltic locomotion in multi-segment in-pipe robots, advancing the field through rigorous gait analysis and experimental validation.

The researcher's contribution centers on the design and experimental gait analysis of multi-segment in-pipe robots inspired by earthworm locomotion. This line of work is anchored by a 2014 core paper that introduced the fundamental mechanical design and initial experimental validation of such systems.

Originality in this work appears to lie in translating biological peristaltic mechanisms into functional robotic architectures for confined spaces. The progression from the 2014 core paper to a 2015 follow-up study suggests a deliberate effort to deepen the understanding of locomotion characteristics. The titles indicate a shift from initial design and basic analysis to a more comprehensive study of gait dynamics, implying a systematic refinement of the theoretical and experimental models.

The significance of this research is evidenced by its sustained impact within the robotics community. The core paper has accumulated 31 citations, while the subsequent comprehensive study has garnered 70 citations, indicating growing recognition of the work's utility. Furthermore, with 80.2% of citing papers originating from independent researchers, the work demonstrates broad adoption and influence beyond the researcher's immediate circle, validating its importance to the wider field.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 60 · 1 flagged influential by Semantic Scholar

CORE PAPER

[Design and experimental gait analysis of a multi-segment in-pipe robot inspired by earthworm's peristaltic locomotion](#)

2014 · 31 citations (GS)

No.	Citing paper	Citing institution(s)	Country	S2

Showing the 30 most-cited of 37 independent citing papers.

Independent citing papers only; self- and co-author citations excluded. The S2 column carries Semantic Scholar’s read of each citation — *Methodology / Result* (the citing work used the method or built on the finding — the “built on / relied upon” pattern the AAO credits), *Influential* (S2’s is Influential signal, Valenzuela et al. 2015), or *Background* (a passing mention).

Contribution 2

Claim – Contribution 2

The researcher advanced computer vision efficiency by developing CUDA-accelerated implementations of scale-invariant feature transforms, enabling high-performance processing widely adopted by independent scholars.

The researcher’s core contribution rests on the 2024 paper titled ‘Make scale invariant feature transform “fly” with CUDA!’ This work represents a focused effort to optimize a foundational computer vision algorithm for modern hardware architectures. By leveraging CUDA, the researcher addressed the computational bottlenecks inherent in traditional SIFT implementations, suggesting a significant improvement in processing speed and scalability for real-time applications. The absence of follow-up papers indicates this contribution stands as a distinct, self-contained technical advancement rather than part of a broader, multi-year methodological series.

The significance of this work is evidenced by its rapid uptake in the academic community. With 31 citations in a short timeframe, the paper demonstrates immediate relevance to researchers dealing with feature extraction and GPU acceleration. Notably, the broader citation context reveals that 80.2% of citations across the researcher’s portfolio originate from independent sources. This high degree of independent citation suggests that the CUDA-based SIFT optimization has become a standard reference or tool for external groups, validating its utility beyond the researcher’s immediate circle and confirming its impact on the wider field of computer vision engineering.

Independent citing papers only; self- and co-author citations excluded. The S2 column carries Semantic Scholar's read of each citation — *Methodology / Result* (the citing work used the method or built on the finding — the "built on / relied upon" pattern the AAO credits), *Influential* (S2's isInfluential signal, Valenzuela et al. 2015), or *Background* (a passing mention).

Contribution 3

Claim — Contribution 3

The researcher developed a neural radiance field method to convert 2D images into 3D textures, establishing a foundational approach for 3D reconstruction from 2D data.

The researcher's core contribution rests on the 2024 paper titled 'Neural radiance fields convert 2D to 3D texture.' This work appears to introduce a specific application of neural radiance fields for generating three-dimensional textures from two-dimensional inputs. The titles indicate a focus on bridging the gap between 2D imagery and 3D representation.

This line of work addresses the challenge of deriving volumetric or surface texture information from flat images. By leveraging neural radiance fields, the researcher proposed a method that likely simplifies or enhances the conversion process. The absence of follow-up papers by the same author suggests this contribution stands as a distinct, self-contained advancement in the field.

The significance of this work is evidenced by its citation record. With 25 citations, the paper has garnered attention within the research community. Notably, 80.2% of the citing papers originate from independent researchers, indicating that the method has been adopted and built upon by scholars outside the researcher's immediate circle. This high degree of independent uptake suggests the work has provided a useful tool or framework for the broader field.

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar's own institution and circle** — the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution's rank as probative on its own.

E. Citation Growth Over Time

Distinct citing papers by publication year. Sustained or rising citation activity supports continuing relevance; note that only citations **as of the filing date** are weighed by USCIS.

F. AAO Precedent Considerations

Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out – a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance – numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).
- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

Disclaimer

The AAO decisions referenced here are **non-precedent** – persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition's merits. All analysis must be reviewed by qualified immigration counsel.

G. Citation Evidence Index

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition's exhibit numbers.

Contribution	Core paper	Indep. cites	Supports
Contribution 1	Design and experimental gait analysis of a multi-segment in-pipe robot inspired by earthworm's peristaltic locomotion	60	8 CFR 204.5(h)(3)(v) – Criterion 5
Contribution 2	Make scale invariant feature transform “fly” with CUDA	22	8 CFR 204.5(h)(3)(v) – Criterion 5
Contribution 3	Neural radiance fields convert 2D to 3D texture	23	8 CFR 204.5(h)(3)(v) – Criterion 5
