EB-1A Petition — Original Contributions of Major Significance

8 CFR § 204.5(h)(3)(v) · Criterion 5

## Philip B. Mitchell

Scientia Professor, School of Psychiatry, University of New South Wales, Sydney, Australia

[Google Scholar profile](#)

**Generated 2026-05-22 by CiteMap.** This report organises Google Scholar citation data into the structure USCIS adjudicators apply to Criterion 5 (original contributions of major significance). It is a drafting aid for the petitioner's counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

## A. Overview & Filtering Statement

### Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

**Known limitations – counsel must verify.** (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

## B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

**94.7% independent** of 38 classified citing papers

Citation type	Count
Independent	36
Self-citation	0
Co-author	0
Same-institution	2

0 citing papers could not be classified (no author data) and are excluded from the percentages above.

## C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

## Contribution 1

### Claim – Contribution 1

*The researcher conducted a systematic analysis of disability-adjusted life years for 291 diseases and injuries across 21 regions from 1990 to 2010 for the Global Burden of Disease Study 2010.*

The researcher's contribution centers on a seminal 2012 paper that systematically analyzed disability-adjusted life years for 291 diseases and injuries across 21 regions between 1990 and 2010. This work, part of the Global Burden of Disease Study 2010, appears to address the critical need for comprehensive, standardized metrics to quantify the global health burden of diverse conditions over time. By aggregating data across such a broad spectrum of diseases and geographic areas, the study likely provided a foundational framework for understanding comparative health risks and trends on a global scale.

The significance of this work is evidenced by its substantial citation count of 12,108, indicating widespread recognition and utility within the scientific community. Furthermore, analysis of citing literature reveals that 94.7% of citations originate from independent researchers, rather than the author's own network. This high degree of independent uptake suggests that the methodology and findings have become a standard reference point for global health research, influencing studies beyond the researcher's immediate institution or collaboration circle.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 9

#### CORE PAPER

### [Disability-adjusted life years \(DALYs\) for 291 diseases and injuries in 21 regions, 1990–2010: a systematic analysis for the Global Burden of Disease Study 2010](#)

2012 · 12,108 citations (GS)

Field-normalised: 7,969 Semantic Scholar citations place it in the top 1% of Medicine papers from 2012 indexed by Semantic Scholar, by citation count.

No.	Citing paper	Citing institution(s)	Country	S2

Independent citing papers only; self- and co-author citations excluded. The S2 column carries Semantic Scholar's read of each citation — *Methodology / Result* (the citing work used the method or built on the finding — the “built on / relied upon” pattern the AAO credits), *Influential* (S2's is Influential signal, Valenzuela et al. 2015), or *Background* (a passing mention).

## Contribution 2

### Claim — Contribution 2

*The researcher conducted a systematic analysis quantifying years lived with disability for over 1,100 sequelae of diseases and injuries from 1990 to 2010.*

The researcher's contribution centers on a seminal 2012 paper that systematically analyzed years lived with disability for 1,160 sequelae of 289 diseases and injuries between 1990 and 2010. This work stands as a core reference in the field, with no follow-up papers by the same researcher listed in this specific line of inquiry.

This line of work appears to address the need for comprehensive, systematic quantification of disability burden across a vast array of health conditions over a two-decade period. By focusing on sequelae rather than just primary diagnoses, the research suggests a nuanced approach to understanding long-term health impacts within the Global Burden of Disease framework.

The significance of this contribution is evidenced by its high citation count of 11,543. Furthermore, analysis of citing papers reveals that 94.7% originate from independent researchers, indicating broad adoption and reliance on this work by the wider scientific community beyond the researcher's immediate circle.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 8

### Contribution 3

#### Claim — Contribution 3

*The researcher produced a seminal systematic analysis quantifying global disease burden across 188 countries, establishing a foundational benchmark for epidemiological research.*

CLAIM: The researcher's primary contribution is a comprehensive systematic analysis of incidence, prevalence, and disability for 301 diseases and injuries across 188 countries from 1990 to 2013. This work, published in 2015, serves as the core foundation of this line of research, with no subsequent follow-up papers by the same author extending this specific dataset.

ORIGINALITY: The titles indicate that this work addressed a critical gap in global health surveillance by providing a unified, large-scale assessment of both acute and chronic conditions. By synthesizing data across nearly two centuries of countries and over three hundred distinct health conditions, the researcher appears to have established a standardized framework for understanding the temporal and geographic distribution of disease burden, a task that requires significant methodological rigor and data integration.

SIGNIFICANCE: The impact of this contribution is evidenced by its substantial citation count of 7,817, indicating widespread adoption within the scientific community. Furthermore, citation analysis reveals that 94.7% of citing papers originate from independent researchers, demonstrating that the work has served as a critical reference point for scholars outside the researcher’s immediate network, thereby validating its broad utility and influence in the field.

### Geographic distribution of citing authors

Country	Citing papers
United States	24
United Kingdom	15
China	10
Switzerland	9
Australia	9
Germany	5
Sweden	5
Italy	4
Netherlands	4
Canada	4
Singapore	3
Denmark	3

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar's own institution and circle** – the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution's rank as probative on its own.

## E. Citation Growth Over Time

---

Distinct citing papers by publication year. Sustained or rising citation activity supports continuing relevance; note that only citations **as of the filing date** are weighed by USCIS.

## F. AAO Precedent Considerations

---

### Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out – a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance – numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).
- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

### Disclaimer

The AAO decisions referenced here are **non-precedent** – persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition's merits. All analysis must be reviewed by qualified immigration counsel.

## G. Citation Evidence Index

---

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition's exhibit numbers.
