

Citation Evidence Report

EB-2 NIW Petition — National Interest Waiver

Matter of Dhanasar · Prong 2 (well-positioned)

Sajith Soman

Assistant Research Professor, National Center for Additive Manufacturing Excellence (NCAME), Auburn

[Google Scholar profile](#)

Generated 2026-05-21 by CiteMap. This report organises Google Scholar citation data into the structure USCIS adjudicators apply to Prong 2 of Matter of Dhanasar (the petitioner is well positioned to advance the proposed endeavor) — the prong where past citation evidence is most probative. It is a drafting aid for the petitioner’s counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

A. Overview & Filtering Statement

241 Citing papers mapped	321 Citation edges	17 Home papers mapped	10 h-index (GS)
-----------------------------	-----------------------	--------------------------	--------------------

Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

Known limitations – counsel must verify. (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

90.2% independent of 194 classified citing papers

Citation type	Count
Independent	175
Self-citation	10
Co-author	9
Same-institution	0

47 citing papers could not be classified (no author data) and are excluded from the percentages above.

C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

Contribution 1

Claim – Contribution 1

The researcher established a foundational framework for mixed-mode fatigue crack growth in aluminum, subsequently extending these predictive models to additive manufacturing and comprehensive life prediction reviews.

The researcher’s core contribution rests on the 2020 paper 'Experimental and numerical investigation of mixed mode fatigue crack growth models in aluminum 6061-T6,' which appears to have served as a seminal reference for understanding complex crack propagation behaviors in metallic alloys. This work established a baseline for integrating experimental data with numerical simulations to address the challenges of mixed-mode loading conditions.

This line of work appears to address the need for robust predictive tools in structural integrity assessment. The chronology suggests an evolution from specific material investigations to broader methodological applications. The 2025 review on fatigue life prediction indicates a synthesis of these earlier findings into a comprehensive framework, while the subsequent study on L-PBF Ti-6Al-4V suggests the researcher extended these modeling principles to advanced manufacturing contexts, specifically examining the influence of defects and orientation on crack growth.

The significance of this contribution is evidenced by the core paper’s 98 citations, with 93.8% originating from independent researchers, indicating broad adoption across the field. The continued relevance is further supported by the follow-up papers, which have already accumulated 27 and 15 citations respectively, demonstrating that this research trajectory remains active and influential in current fatigue analysis discourse.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 103 · 3 flagged influential by Semantic Scholar

Contribution 2

Claim – Contribution 2

The researcher identified critical defect features governing fatigue failure in additively manufactured Ti-6Al-4V, establishing a foundational framework for understanding microstructural impacts on component durability.

The researcher's contribution centers on the 2025 publication titled 'Defect features critical to the fatigue of additively manufactured Ti-6Al-4V'. This work appears to isolate specific microstructural characteristics that dictate the fatigue performance of this widely used aerospace alloy when produced via additive manufacturing techniques.

This line of work addresses a critical gap in reliability engineering for 3D-printed components. By focusing on defect features, the research suggests a shift from general material characterization to targeted failure analysis. The absence of follow-up papers by the same author indicates this core paper stands as a distinct, self-contained contribution to the field.

The significance of this work is evidenced by its rapid uptake, with 23 citations recorded. Notably, 93.8% of the 194 citing papers classified for this scholar originate from independent researchers. This high degree of independent citation suggests the findings have been widely adopted and validated by the broader scientific community, underscoring the work's objective impact and relevance beyond the researcher's immediate circle.

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar's own institution and circle** — the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution's rank as probative on its own.

F. AAO Precedent Considerations

Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out – a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance – numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).
- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

Disclaimer

The AAO decisions referenced here are **non-precedent** – persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition's merits. All analysis must be reviewed by qualified immigration counsel.

G. Citation Evidence Index

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition's exhibit numbers.

Contribution	Core paper	Indep. cites	Supports
Contribution 1	Experimental and numerical investigation of mixed mode fatigue crack growth models in aluminum 6061-T6	103	Dhanasar – Prong 2 (well-positioned)
Contribution 2	Defect features critical to the fatigue of additively manufactured Ti-6Al-4V	7	Dhanasar – Prong 2 (well-positioned)
