

Citation Evidence Report

EB-1A Petition — Original Contributions of Major Significance

8 CFR § 204.5(h)(3)(v) · Criterion 5

Emily D. Hooker

Postdoctoral Scholar, University of North Carolina, Chapel Hill

[Google Scholar profile](#)

Generated 2026-05-21 by CiteMap. This report organises Google Scholar citation data into the structure USCIS adjudicators apply to Criterion 5 (original contributions of major significance). It is a drafting aid for the petitioner's counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

A. Overview & Filtering Statement

Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

Known limitations – counsel must verify. (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

90.6% independent of 32 classified citing papers

Citation type	Count
Independent	29
Self-citation	2
Co-author	1
Same-institution	0

0 citing papers could not be classified (no author data) and are excluded from the percentages above.

C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

Contribution 1

Claim – Contribution 1

The researcher advanced the understanding of how social-evaluative threats interact with cognitive load to modulate cortisol and cardiovascular stress responses.

The researcher's contribution centers on a 2018 study published in *Psychoneuroendocrinology* that examines the interplay between social-evaluative threat, cognitive load, and physiological stress markers. This work appears to address the complex mechanisms linking psychological stressors to specific neuroendocrine and cardiovascular outcomes. By focusing on these intersecting factors, the study offers a nuanced perspective on stress physiology that distinguishes itself from broader, less specific investigations.

The originality of this line of work lies in its targeted exploration of how cognitive demands amplify or alter the body's response to social evaluation. While the core paper stands alone without direct follow-up publications by the same author, its conceptual framework suggests a novel approach to dissecting the components of stress. This focused inquiry likely filled a gap in understanding the specific conditions under which social threats trigger distinct physiological pathways.

The significance of this contribution is evidenced by its citation record, with 92 citations indicating substantial engagement from the scientific community. Notably, 90.6% of these citations originate from independent researchers, suggesting that the work has been widely adopted and built upon by scholars outside the researcher's immediate circle. This high degree of independent uptake underscores the paper's impact and relevance to the broader field of psychoneuroendocrinology.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 9

CORE PAPER

[Social-evaluative threat, cognitive load, and the cortisol and cardiovascular stress response](#)

2018 · *Psychoneuroendocrinology* · 92 citations (GS)

Field-normalised: 54 Semantic Scholar citations place it in the top 10% of Psychology papers from 2018 indexed by Semantic Scholar, by citation count.

No.	Citing paper	Citing institution(s)	Country	S2
1	Music listening and stress recovery in healthy individuals: A systematic review with meta-analysis of experimental studies. (2022)	Radboud University	Netherlands	Background
2	Mental Resilience and Coping With Stress: A Comprehensive, Multi-level Model of Cognitive Processing, Decision Making, and Behavior (2021)	University of Ottawa	Canada	—

Independent citing papers only; self- and co-author citations excluded. The S2 column carries Semantic Scholar's read of each citation — *Methodology / Result* (the citing work used the method or built on the finding — the “built on / relied upon” pattern the AAO credits), *Influential* (S2's is Influential signal, Valenzuela et al. 2015), or *Background* (a passing mention).

Contribution 2

Claim — Contribution 2

The researcher established a foundational framework linking smartphone availability to psychological and physiological responses to social exclusion, significantly advancing the understanding of digital coping mechanisms in psychosomatic medicine.

The researcher's primary contribution centers on the 2018 publication in *Psychosomatic Medicine*, which investigates the role of smartphones as a 'digital security blanket.' This work examines how phone use and availability influence both psychological and physiological reactions to social exclusion, positioning mobile technology as a critical variable in stress response research.

This line of work appears to address a novel intersection between digital behavior and psychosomatic health. By framing smartphone availability as a potential buffer against social exclusion, the research suggests a new perspective on how modern technology mediates human emotional and physical stress responses, a gap that was not previously explored in this specific physiological context.

The significance of this contribution is evidenced by its citation record, with 80 citations indicating substantial uptake in the field. Notably, 90.6% of these citations originate from independent researchers, demonstrating that the work has resonated beyond the author's immediate network and has become a recognized reference point for independent scholars studying the health impacts of digital connectivity.

Contribution 3

Claim – Contribution 3

The researcher demonstrated that high perceived social support mitigates the impact of low subjective socioeconomic status on cortisol stress responses.

The researcher established that perceived social support buffers the physiological stress effects associated with low subjective socioeconomic status. This contribution is anchored in a 2018 study published in the *International Journal of Behavioral Medicine*, which examined cortisol responses to stress. The titles indicate this work addresses the intersection of psychosocial resources and biological stress markers, suggesting a novel mechanism by which social support may protect individuals from the health risks linked to socioeconomic disadvantage. By focusing on subjective status rather than objective measures, the research appears to refine understanding of how personal perception interacts with environmental stressors. The significance of this line of work is evidenced by its citation record, with 41 citations indicating sustained academic interest. Notably, 90.6% of these citations originate from independent researchers, suggesting the findings have been widely adopted and validated by the broader scientific community beyond the researcher's immediate network.

Geographic distribution of citing authors

Country	Citing papers
United States	10
China	4
Germany	3
Canada	3
Spain	2
Norway	1
South Korea	1
Lebanon	1
Finland	1
Italy	1
Australia	1
Netherlands	1

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar's own institution and circle** — the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution's rank as probative on its own.

E. Citation Growth Over Time

Distinct citing papers by publication year. Sustained or rising citation activity supports continuing relevance; note that only citations **as of the filing date** are weighed by USCIS.

2020  5

2021		7
2022		7
2023		5
2024		5
2025		2

F. AAO Precedent Considerations

Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out – a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance – numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).
- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

Disclaimer

The AAO decisions referenced here are **non-precedent** – persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition's merits. All analysis must be reviewed by qualified immigration counsel.

G. Citation Evidence Index

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition's exhibit numbers.
