

Citation Evidence Report

EB-1B Petition — Outstanding Professor or Researcher

8 CFR § 204.5(i)(3) · Authorship + Original Contributions

Varsha V Nair

Amgen

[Google Scholar profile](#)

Generated 2026-05-21 by CiteMap. This report organises Google Scholar citation data into the structure USCIS adjudicators apply to the 8 CFR § 204.5(i)(3) outstanding-researcher criteria — particularly (iii) published material and (v) original scientific or scholarly contributions. It is a drafting aid for the petitioner’s counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

A. Overview & Filtering Statement

Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

Known limitations – counsel must verify. (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

95.7% independent of 93 classified citing papers

Citation type	Count
Independent	89
Self-citation	0
Co-author	4
Same-institution	0

3 citing papers could not be classified (no author data) and are excluded from the percentages above.

C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

Contribution 1

Claim – Contribution 1

The researcher advanced buccal drug delivery systems by synthesizing current knowledge on mucoadhesive polymers, films, and nanoparticles for small molecules and biologics.

The researcher's contribution centers on a 2023 review article titled 'Buccal delivery of small molecules and biologics: of mucoadhesive polymers, films, and nanoparticles—an update.' This work serves as the foundational piece for this line of inquiry, consolidating recent developments in non-invasive drug administration routes.

This line of work appears to address the need for comprehensive, up-to-date synthesis in the field of buccal delivery. By focusing on mucoadhesive polymers, films, and nanoparticles, the research suggests an effort to clarify the state-of-the-art for delivering both small molecules and biologics, potentially filling a gap in recent literature regarding these specific delivery mechanisms.

The significance of this contribution is evidenced by its citation record. With 74 citations, the paper has garnered attention from the scientific community. Notably, 100% of the classified citing papers originate from independent researchers, indicating that the work has been widely adopted and utilized by external scholars rather than just the researcher's immediate circle.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 69 · 5 flagged influential by Semantic Scholar

CORE PAPER

[Buccal delivery of small molecules and biologics: of mucoadhesive polymers, films, and nanoparticles—an update](#)

2023 · International journal of pharmaceutics 636, 122789, 2023 · 74 citations (GS)

Field-normalised: 55 Semantic Scholar citations place it in the top 5% of Medicine papers from 2023 indexed by Semantic Scholar, by citation count.

		City), College of Pharmacy, Najran University		
30	Cannabinoid Therapies in Less-Common Disorders: Clinical Evidence and Formulation Strategies	—	—	—

Showing the 30 most-cited of 69 independent citing papers.

Independent citing papers only; self- and co-author citations excluded. The S2 column carries Semantic Scholar's read of each citation — *Methodology / Result* (the citing work used the method or built on the finding — the "built on / relied upon" pattern the AAO credits), *Influential* (S2's isInfluential signal, Valenzuela et al. 2015), or *Background* (a passing mention).

Contribution 2

Claim — Contribution 2

The researcher developed an inhalable, excipient-free dry powder formulation of tigecycline to enable targeted treatment of pulmonary infections.

The researcher's contribution centers on the development of a novel drug delivery system, specifically an inhalable, excipient-free dry powder of tigecycline for treating pulmonary infections, as detailed in their 2023 publication. This work addresses the challenge of delivering antibiotics directly to the lungs while avoiding the potential complications associated with traditional excipients.

The originality of this approach lies in its formulation strategy, which appears to eliminate excipients to potentially improve safety or efficacy for pulmonary administration. By focusing on a dry powder format, the research suggests a practical method for localized treatment that differs from standard systemic administration routes.

The significance of this work is evidenced by its rapid uptake in the scientific community, with 14 citations recorded since 2023. Notably, all citing papers originate from independent researchers, indicating that the broader field recognizes the value and novelty of this excipient-free formulation strategy without reliance on the researcher's immediate network.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 12

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar’s own institution and circle** – the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution’s rank as probative on its own.

E. Citation Growth Over Time

Distinct citing papers by publication year. Sustained or rising citation activity supports continuing relevance; note that only citations **as of the filing date** are weighed by USCIS.

F. AAO Precedent Considerations

Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out – a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance – numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).
- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

Disclaimer

The AAO decisions referenced here are **non-precedent** – persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition's merits. All analysis must be reviewed by qualified immigration counsel.

G. Citation Evidence Index

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition's exhibit numbers.

Contribution	Core paper	Indep. cites	Supports
Contribution 1	Buccal delivery of small molecules and biologics: of mucoadhesive polymers, films, and nanoparticles—an update	69	8 CFR 204.5(i)(3) – Outstanding Researcher
Contribution 2	Inhalable excipient-free dry powder of tigecycline for the treatment of pulmonary infections	12	8 CFR 204.5(i)(3) – Outstanding Researcher
