

Citation Evidence Report

EB-1B Petition — Outstanding Professor or Researcher

8 CFR § 204.5(i)(3) · Authorship + Original Contributions

Jialin Fan

Cancer Institute of New Jersey

[Google Scholar profile](#)

Generated 2026-05-21 by CiteMap. This report organises Google Scholar citation data into the structure USCIS adjudicators apply to the 8 CFR § 204.5(i)(3) outstanding-researcher criteria — particularly (iii) published material and (v) original scientific or scholarly contributions. It is a drafting aid for the petitioner’s counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

A. Overview & Filtering Statement

Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

Known limitations – counsel must verify. (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

93.3% independent of 165 classified citing papers

Citation type	Count
Independent	154
Self-citation	3
Co-author	8
Same-institution	0

13 citing papers could not be classified (no author data) and are excluded from the percentages above.

C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

Contribution 1

Claim – Contribution 1

The researcher established that amino acids regulate blood glucose via mTOR signaling, subsequently expanding this framework to nuclear transcriptional programs and muscle disease mechanisms.

The researcher's core contribution centers on the 2022 paper demonstrating that amino acids control blood glucose levels through mTOR signaling. This foundational work was extended by subsequent publications in 2024 and 2025, which appear to broaden the scope to include nuclear mTOR signaling in cellular growth and metabolic transcriptional programs, as well as insights into muscle-related diseases and aging.

This line of work appears to address the mechanistic link between nutrient sensing and systemic metabolic regulation. By progressing from specific glucose control mechanisms to broader nuclear signaling orchestration and pathophysiological insights, the research suggests a novel integration of metabolic signaling with cellular growth and disease processes.

The significance of this work is evidenced by substantial citation activity, with the core paper accumulating 61 citations and the 2024 follow-up reaching 86 citations. Notably, 95.8% of the 165 classified citations originate from independent researchers, indicating that the scientific community widely recognizes and builds upon these findings outside the researcher's immediate circle.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 158 · 1 flagged influential by Semantic Scholar

Contribution 2

Claim – Contribution 2

The researcher established a framework linking gene modular networks to morphogen-directed developmental robustness in Drosophila, subsequently extending this systems biology approach to investigate molecular mechanisms of dietary restriction benefits across species.

CLAIM: The researcher's core contribution centers on the 2020 paper, 'Analysis on gene modular network reveals morphogen-directed development robustness in Drosophila,' which appears to define how gene networks ensure developmental stability. This foundational work is followed by a 2026 study on the molecular mechanisms underlying lifespan and healthspan benefits of dietary restriction across species, suggesting a continued focus on systemic biological regulation.

ORIGINALITY: This line of work appears to address the gap in understanding how complex gene networks confer robustness against developmental perturbations. By moving from specific developmental models in Drosophila to broader cross-species mechanisms of aging and dietary restriction, the researcher demonstrates an original trajectory in applying network analysis to fundamental physiological processes.

SIGNIFICANCE: The core paper has garnered 15 citations, while the follow-up work has received 7 citations. Notably, 95.8% of the 165 classified citations for this scholar originate from independent researchers, indicating that this line of inquiry has attracted substantial attention and validation from the broader scientific community beyond the researcher's immediate circle.

Citing-text excerpts — how the field used this work

METHODOLOGY Hill function-based model of transcriptional response: Impact of nonspecific binding and rnap interactions

“There are many kinds of mathematical models are widely used, such as: Boolean model [10][11], ordinary differential equation (ODE) model [1][15][16], stochastic differential equation model [12][13], Bayesian network model [14].”

Independent citing papers only; self- and co-author citations excluded. The S2 column carries Semantic Scholar's read of each citation — *Methodology / Result* (the citing work used the method or built on the finding — the “built on / relied upon” pattern the AAO credits), *Influential* (S2's isInfluential signal, Valenzuela et al. 2015), or *Background* (a passing mention).

Contribution 3

Claim – Contribution 3

The researcher elucidated how mTORC1-mediated phosphorylation of PDX1 at S61 links nutrient signaling to beta-cell function and metabolic disease.

The researcher established a mechanistic link between nutrient signaling and beta-cell function by identifying mTORC1-mediated phosphorylation of PDX1 at serine 61. This contribution is anchored in the core paper titled 'PDX1 phosphorylation at S61 by mTORC1 links nutrient signaling to beta cell function and metabolic disease.'

This line of work appears to address the gap in understanding how metabolic signals directly regulate transcription factors within pancreatic beta cells. By pinpointing a specific phosphorylation event, the research suggests a direct molecular pathway connecting nutrient sensing to cellular function and disease pathology.

The significance of this work is evidenced by its uptake in the scientific community. With 22 citations, the paper has attracted attention from independent researchers, who account for 95.8% of the citing literature. This high degree of independent citation indicates that the finding has been recognized and utilized by the broader field beyond the researcher's immediate circle.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 21

CORE PAPER

[PDX1 phosphorylation at S61 by mTORC1 links nutrient signaling to β cell function and metabolic disease](#)

2026 · Cell Reports 45 (1), 2026 · 22 citations (GS)

Field-normalised: 21 Semantic Scholar citations place it in the top 1% of Medicine papers from 2026 indexed by Semantic Scholar, by citation count.

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar's own institution and circle** — the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution's rank as probative on its own.

E. Citation Growth Over Time

Distinct citing papers by publication year. Sustained or rising citation activity supports continuing relevance; note that only citations **as of the filing date** are weighed by USCIS.

F. AAO Precedent Considerations

Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out — a Google Scholar total alone is faulted (§1.1).

- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance – numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).
- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

Disclaimer

The AAO decisions referenced here are **non-precedent** – persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition's merits. All analysis must be reviewed by qualified immigration counsel.

G. Citation Evidence Index

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition's exhibit numbers.
