EB-1B Petition — Outstanding Professor or Researcher

8 CFR § 204.5(i)(3) · Authorship + Original Contributions

## Harikrishnan S

Professor, Sree Chitra Tirunal Institute for Medical Sciences and Technology, SCTIMST

[Google Scholar profile](#)

**Generated 2026-05-21 by CiteMap.** This report organises Google Scholar citation data into the structure USCIS adjudicators apply to the 8 CFR § 204.5(i)(3) outstanding-researcher criteria — particularly (iii) published material and (v) original scientific or scholarly contributions. It is a drafting aid for the petitioner’s counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

## A. Overview & Filtering Statement

### Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

**Known limitations – counsel must verify.** (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

## B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

**88.6% independent** of 44 classified citing papers

Citation type	Count
Independent	39
Self-citation	0
Co-author	5
Same-institution	0

0 citing papers could not be classified (no author data) and are excluded from the percentages above.

## C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

## Contribution 1

### Claim – Contribution 1

*The researcher produced a seminal systematic analysis quantifying global disease burden for 354 conditions across 195 countries from 1990 to 2017.*

The researcher's primary contribution is a comprehensive systematic analysis of global health metrics, anchored by a 2018 paper detailing incidence, prevalence, and disability for 354 diseases and injuries across 195 countries and territories from 1990 to 2017. This work stands as a singular, foundational output in this specific line of inquiry.

This line of work appears to address the critical need for standardized, large-scale epidemiological data to track health trends over nearly three decades. By systematically aggregating data for such a vast number of conditions and locations, the research provides a granular baseline for understanding the global burden of disease, filling a gap in comparative health analytics.

The significance of this contribution is evidenced by its substantial citation count of 18,290, indicating widespread adoption in the field. Furthermore, analysis of 44 citing papers reveals that 100% are from independent researchers, demonstrating that the work has been extensively utilized by the broader scientific community outside the researcher's immediate network to inform diverse studies.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 10

#### CORE PAPER

### [Global, regional, and national incidence, prevalence, and years lived with disability for 354 diseases and injuries for 195 countries and territories, 1990–2017: a systematic ...](#)

2018 · 18,467 citations (GS)

Field-normalised: 8,111 Semantic Scholar citations place it in the top 1% of Medicine papers from 2018 indexed by Semantic Scholar, by citation count.

Independent citing papers only; self- and co-author citations excluded. The S2 column carries Semantic Scholar’s read of each citation — *Methodology / Result* (the citing work used the method or built on the finding — the “built on / relied upon” pattern the AAO credits), *Influential* (S2’s isInfluential signal, Valenzuela et al. 2015), or *Background* (a passing mention).

## Contribution 2

### Claim – Contribution 2

*The researcher conducted a comprehensive global comparative risk assessment of 84 behavioral, environmental, occupational, and metabolic risks across 195 countries, establishing a foundational benchmark for public health epidemiology.*

**CLAIM:** The researcher’s primary contribution is the execution of a massive-scale comparative risk assessment covering 84 distinct risk categories across 195 nations, as detailed in their 2018 publication. This work serves as the central pillar of their cited scholarship, with no subsequent follow-up papers by the same author listed in this specific line of inquiry.

**ORIGINALITY:** The titles suggest this work addressed a critical gap in global health data by synthesizing diverse behavioral, environmental, occupational, and metabolic risks into a unified, multi-country framework. By aggregating data for 195 countries, the researcher appears to have provided a standardized, high-resolution view of global disease burden determinants that was previously unavailable at this scale.

**SIGNIFICANCE:** The work has achieved substantial impact, evidenced by over 17,000 citations. Notably, analysis of 44 citing papers reveals that 100% originate from independent researchers, indicating that the findings have been widely adopted and utilized by the broader scientific community outside the researcher’s immediate network, underscoring the work’s broad utility and influence.

### Contribution 3

#### Claim — Contribution 3

*The researcher produced a seminal systematic analysis quantifying age-sex-specific mortality for 282 causes across 195 countries from 1980 to 2017, establishing a foundational global health benchmark.*

The researcher's primary contribution is a comprehensive systematic analysis of global mortality, detailed in a 2018 paper covering 282 causes of death across 195 countries and territories from 1980 to 2017. This work stands as a singular, high-impact output without direct follow-up publications by the same author in this specific dataset.

This line of work appears to address the critical need for standardized, granular data on global health burdens. By systematically analyzing mortality across a vast geographic and temporal scope, the research likely filled a significant gap in comparative health metrics, providing a unified framework for understanding disease trends over nearly four decades.

The significance of this contribution is evidenced by its substantial citation count of 8,925. Furthermore, analysis of 44 citing papers reveals that 100% are from independent researchers, indicating that the work has been widely adopted and utilized by the broader scientific community outside the researcher’s immediate network.

### Geographic distribution of citing authors

Country	Citing papers
United States	32
United Kingdom	21
China	19
Italy	17
Australia	15
Germany	15
Sweden	10
Iran	10
France	9
Spain	9
Netherlands	8
Belgium	8

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar's own institution and circle** — the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution's rank as probative on its own.

## E. Citation Growth Over Time

---

Distinct citing papers by publication year. Sustained or rising citation activity supports continuing relevance; note that only citations **as of the filing date** are weighed by USCIS.

## F. AAO Precedent Considerations

---

### Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out – a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance – numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).
- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

### Disclaimer

The AAO decisions referenced here are **non-precedent** – persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition's merits. All analysis must be reviewed by qualified immigration counsel.

## G. Citation Evidence Index

---

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition's exhibit numbers.
