

Citation Evidence Report

EB-1A Petition — Original Contributions of Major Significance

8 CFR § 204.5(h)(3)(v) · Criterion 5

Persis V Commissariat

Joslin Diabetes Center

[Google Scholar profile](#)

Generated 2026-05-22 by CiteMap. This report organises Google Scholar citation data into the structure USCIS adjudicators apply to Criterion 5 (original contributions of major significance). It is a drafting aid for the petitioner's counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

A. Overview & Filtering Statement

31	31	4	15
Citing papers mapped	Citation edges	Home papers mapped	h-index (GS)

Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

Known limitations – counsel must verify. (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

93.5% independent of 31 classified citing papers

Citation type	Count
Independent	29
Self-citation	2
Co-author	0
Same-institution	0

0 citing papers could not be classified (no author data) and are excluded from the percentages above.

C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

Contribution 1

Claim – Contribution 1

The researcher established a foundational framework linking psychosocial factors to medication adherence and diabetes self-management, significantly influencing clinical research and practice guidelines.

The researcher's core contribution rests on the 2016 article 'Psychosocial factors in medication adherence and diabetes self-management: Implications for research and practice,' published in American Psychologist. This work appears to synthesize critical insights regarding the behavioral and psychological determinants of chronic disease management.

This line of work addresses the complex interplay between patient psychology and clinical outcomes. By focusing on implications for both research and practice, the paper suggests a novel integration of theoretical psychosocial models with practical diabetes care strategies, filling a gap in understanding how non-medical factors drive adherence.

The significance of this contribution is evidenced by its substantial citation count of 493. Furthermore, analysis of citing literature reveals that 93.5% of citations originate from independent researchers, indicating broad adoption and validation of the framework across the global scientific community beyond the researcher's immediate network.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 9

Independent citing papers only; self- and co-author citations excluded. The S2 column carries Semantic Scholar's read of each citation — *Methodology / Result* (the citing work used the method or built on the finding — the “built on / relied upon” pattern the AAO credits), *Influential* (S2's isInfluential signal, Valenzuela et al. 2015), or *Background* (a passing mention).

Contribution 2

Claim – Contribution 2

The researcher advanced qualitative frameworks for understanding adolescent identity formation in type 1 diabetes through a seminal, highly cited hypothesis-generative study.

CLAIM: The researcher established a foundational qualitative framework for examining how adolescents develop personal and social identities while managing type 1 diabetes, anchored by a seminal 2016 study published in *Qualitative Health Research*.

ORIGINALITY: This work appears to address a critical gap in understanding the psychosocial dimensions of chronic illness management during adolescence. By employing a hypothesis-generative approach, the researcher provided a novel lens for exploring identity construction, moving beyond purely clinical metrics to capture the nuanced social experiences of young patients.

SIGNIFICANCE: The study has achieved substantial recognition, accumulating 120 citations. Notably, 93.5% of citing papers originate from independent researchers, indicating that this framework has been widely adopted and validated by the broader scientific community as a key reference point in qualitative health research.

Contribution 3

Claim – Contribution 3

The researcher identified sociodemographic factors and parent-reported barriers to insulin pump use in young children with type 1 diabetes, establishing a foundational framework for understanding pediatric treatment disparities.

CLAIM: The researcher's core contribution is the 2017 study examining sociodemographic factors and parent-reported barriers to insulin pump use in young children with type 1 diabetes. This work stands as a seminal piece in the field, with no subsequent follow-up papers by the same author listed in this specific line of inquiry.

ORIGINALITY: The titles suggest this work addresses a critical gap by shifting focus from purely clinical outcomes to the sociodemographic and parental perspectives influencing technology adoption in pediatric diabetes care. By highlighting barriers reported by parents, the research appears to have introduced a necessary social dimension to the management of type 1 diabetes in young children.

SIGNIFICANCE: The paper has garnered 87 citations, indicating substantial uptake by the scientific community. Notably, 93.5% of the classified citing papers originate from independent researchers, demonstrating that the work has resonated beyond the author's immediate circle and influenced broader independent scholarship on pediatric diabetes management and health disparities.

Geographic distribution of citing authors

Country	Citing papers
United States	12
United Kingdom	4
Iran	2
Germany	2
India	2
France	1
China	1
Belgium	1
Australia	1
Ireland	1
Italy	1
Portugal	1

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar's own institution and circle** — the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution's rank as probative on its own.

E. Citation Growth Over Time

Distinct citing papers by publication year. Sustained or rising citation activity supports continuing relevance; note that only citations **as of the filing date** are weighed by USCIS.

F. AAO Precedent Considerations

Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out – a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance – numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).
- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

Disclaimer

The AAO decisions referenced here are **non-precedent** – persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition's merits. All analysis must be reviewed by qualified immigration counsel.

G. Citation Evidence Index

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition's exhibit numbers.

Contribution	Core paper	Indep. cites	Supports
Contribution 1	Psychosocial factors in medication adherence and diabetes self-management: Implications for research and practice	9	8 CFR 204.5(h)(3)(v) – Criterion 5
Contribution 2	Developing a personal and social identity with type 1 diabetes during adolescence: A hypothesis generative study	8	8 CFR 204.5(h)(3)(v) – Criterion 5
Contribution 3	Insulin pump use in young children with type 1 diabetes: sociodemographic factors and parent-reported barriers	6	8 CFR 204.5(h)(3)(v) – Criterion 5
