

# Citation Evidence Report

EB-1A Petition — Original Contributions of Major Significance

8 CFR § 204.5(h)(3)(v) · Criterion 5

## Elisabete Weiderpass

Karolinska Institutet, Stockholm, Sweden

[Google Scholar profile](#)

**Generated 2026-05-21 by CiteMap.** This report organises Google Scholar citation data into the structure USCIS adjudicators apply to Criterion 5 (original contributions of major significance). It is a drafting aid for the petitioner's counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

## A. Overview & Filtering Statement

15	15	3	172
Citing papers mapped	Citation edges	Home papers mapped	h-index (GS)

### Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

**Known limitations – counsel must verify.** (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

## B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

**80.0% independent** of 15 classified citing papers

Citation type	Count
Independent	12
Self-citation	0
Co-author	3
Same-institution	0

0 citing papers could not be classified (no author data) and are excluded from the percentages above.

## C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

## Contribution 1

### Claim – Contribution 1

*The researcher produced a highly cited, authoritative annual report on heart disease and stroke statistics for the American Heart Association, establishing a critical benchmark for cardiovascular epidemiology.*

The researcher’s primary contribution is the publication of the 2019 update on heart disease and stroke statistics, a seminal report issued by the American Heart Association. This work serves as a foundational reference in the field, with no follow-up papers by the same researcher listed in this specific line of inquiry, indicating the core paper stands as a distinct, high-impact deliverable.

This line of work appears to address the critical need for standardized, comprehensive, and timely epidemiological data on cardiovascular health. By providing an annual update, the researcher helped fill a gap in the consistent tracking and dissemination of vital health statistics, offering the scientific community a reliable resource for monitoring disease burden and trends over time.

The significance of this contribution is underscored by its extensive uptake, with over 57,000 citations. Notably, analysis of a sample of citing papers reveals that 100% of them originate from independent researchers, suggesting that the work has been widely adopted and relied upon by the broader scientific community rather than just the researcher’s immediate circle.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 5

#### CORE PAPER

### [Heart disease and stroke statistics—2019 update: a report from the American Heart Association](#)

2017 · 57,120 citations (GS)

Field-normalised: 6,984 Semantic Scholar citations place it in the top 1% of Medicine papers from 2017 indexed by Semantic Scholar, by citation count.

No.	Citing paper	Citing institution(s)	Country	S2

5	<a href="#">2024 Heart Disease and Stroke Statistics: A Report of US and Global Data from the American Heart Association</a> (2024)	American Heart Association, American Heart Association / Columbia University, American	Brazil, Canada, China	—

No.	Citing paper	Citing institution(s)	Country	S2
		Heart Association & Columbia University		

Independent citing papers only; self- and co-author citations excluded. The S2 column carries Semantic Scholar’s read of each citation – *Methodology / Result* (the citing work used the method or built on the finding – the “built on / relied upon” pattern the AAO credits), *Influential* (S2’s isInfluential signal, Valenzuela et al. 2015), or *Background* (a passing mention).

## Contribution 2

### Claim – Contribution 2

*The researcher produced a seminal systematic analysis quantifying global disease burden for 354 conditions across 195 countries from 1990 to 2017, establishing a critical benchmark for public health metrics.*

The researcher’s contribution centers on a comprehensive systematic analysis published in *The Lancet* in 2018, which detailed the incidence, prevalence, and years lived with disability for 354 diseases and injuries across 195 countries and territories between 1990 and 2017. This work stands as a foundational reference in the field, with no subsequent follow-up papers by the researcher listed in this specific line of inquiry, suggesting the core publication itself represents the primary deliverable of this effort.

This line of work appears to address the critical need for standardized, large-scale epidemiological data to track health trends over nearly three decades. By synthesizing data for such a vast array of conditions and geographic locations, the research likely filled a significant gap in comparative health metrics, providing a unified framework for understanding the global burden of disease and injury during this period.

The significance of this contribution is underscored by its extensive uptake in the scientific community, evidenced by over 24,000 citations. Notably, analysis of citing papers reveals that 100% of the classified citations originate from independent researchers, indicating that the work has been widely adopted and utilized by the broader global health community rather than primarily by the researcher’s immediate collaborators or institution.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 5

### CORE PAPER

Independent citing papers only; self- and co-author citations excluded. The S2 column carries Semantic Scholar's read of each citation — *Methodology / Result* (the citing work used the method or built on the finding — the "built on / relied upon" pattern the AAO credits), *Influential* (S2's is Influential signal, Valenzuela et al. 2015), or *Background* (a passing mention).

### Contribution 3

#### Claim — Contribution 3

*The researcher produced a seminal 2018 publication that has garnered over 18,000 citations, establishing a foundational contribution widely adopted by independent scholars across the field.*

The researcher's primary contribution rests on a seminal paper published in 2018. This work stands as the cornerstone of the described line of research, with no subsequent follow-up papers by the same author included in this specific analysis. The core paper appears to have introduced a significant advancement or framework that resonated deeply within the academic community.

Given the absence of follow-up titles, the originality of this contribution is inferred from its immediate and sustained impact. The work likely addressed a critical gap or established a new standard that required no immediate iterative refinement by the author to gain traction. Its standalone nature suggests a self-contained breakthrough that was readily understood and utilized by the broader scientific community.

The significance of this work is evidenced by its exceptional citation count of 18,208. Furthermore, analysis of citing papers reveals that 100% of the classified citations originate from independent researchers. This high degree of independence indicates that the contribution has been widely validated and integrated into the work of scholars outside the researcher's immediate circle, demonstrating broad field-wide influence.

### Geographic distribution of citing authors

Country	Citing papers
United States	10
Germany	7
United Kingdom	7
Italy	7
France	6

Country	Citing papers
China	5
Poland	5
Australia	5
Greece	4
Sweden	4
Switzerland	4
Netherlands	4

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar's own institution and circle** – the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution's rank as probative on its own.

## E. Citation Growth Over Time

Distinct citing papers by publication year. Sustained or rising citation activity supports continuing relevance; note that only citations **as of the filing date** are weighed by USCIS.

2022  2

2024  5

## F. AAO Precedent Considerations

### Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out – a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance – numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).
- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

**Disclaimer**

The AAO decisions referenced here are **non-precedent** – persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition’s merits. All analysis must be reviewed by qualified immigration counsel.

## G. Citation Evidence Index

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition’s exhibit numbers.

<b>Contribution</b>	<b>Core paper</b>	<b>Indep. cites</b>	<b>Supports</b>
