[Google Scholar profile](#)

Generated 2026-06-08 by CiteMap. This report organises Google Scholar citation data into the structure USCIS adjudicators apply to the 8 CFR § 204.5(i)(3) outstanding-researcher criteria — particularly (iii) published material and (v) original scientific or scholarly contributions. It is a drafting aid for the petitioner’s counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

A. Overview & Filtering Statement

Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

Known limitations – counsel must verify. (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

81.5% independent of 1,629 classified citing papers

Citation type	Count
Independent	1,327
Self-citation	86
Co-author	216
Same-institution	0

726 citing papers could not be classified (no author data) and are excluded from the percentages above.

C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

Contribution 1

Claim – Contribution 1

The researcher established a foundational experimental framework for analyzing fine-grain movement in unconsolidated soils under heavy rainfall, significantly advancing the understanding of soil instability mechanisms.

CLAIM: The researcher's primary contribution lies in establishing a foundational experimental framework for analyzing the moving characteristics of fine grains in wide grading unconsolidated soil under heavy rainfall, as demonstrated by the seminal 2017 paper. This work serves as the cornerstone for subsequent investigations into particle dynamics and geotechnical stability.

ORIGINALITY: This line of work appears to address critical gaps in understanding how fine particles behave within porous media during extreme weather events. By progressing from macroscopic experimental studies to micromechanical insights in analog pore systems, the researcher expanded the theoretical scope from general soil characteristics to specific clogging and unclogging mechanisms. The inclusion of case studies on urbanization-related landslides further suggests an effort to bridge fundamental soil mechanics with real-world disaster prevention.

SIGNIFICANCE: The impact of this research is evidenced by substantial citation metrics, with the core paper accumulating 177 citations and the 2019 landslide study reaching 219 citations. Notably, 81.5% of the 1,629 classified citations originate from independent researchers, indicating that the community widely recognizes and builds upon these findings beyond the researcher's immediate circle. This high degree of independent uptake underscores the broad relevance and utility of the proposed frameworks in both academic and practical contexts.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 263 · 2 flagged influential by Semantic Scholar

Contribution 2

Claim – Contribution 2

The researcher developed a novel Discrete Element Method framework for simulating sand production, establishing a foundational approach for analyzing granular flow dynamics and barrier interactions in geotechnical engineering.

The researcher's significant contribution centers on a 2016 core paper titled 'A new approach to DEM simulation of sand production,' which introduced a distinct methodology for modeling granular material behavior. This work serves as the technical foundation for subsequent research, including studies on particle size effects in granular flows and landslide reconstruction using seismic signals and numerical simulations.

This line of work appears to address the challenge of accurately simulating complex granular interactions, extending from subsurface sand production to large-scale geohazards like landslides. The progression from the 2016 core paper to follow-up studies in 2018 and 2020 suggests a systematic expansion of the initial simulation framework to tackle diverse scenarios involving rigid barriers and seismic characteristics.

The impact of this research is evidenced by substantial citation counts, with the core paper accumulating 128 citations and follow-up works receiving 118 and 109 citations respectively. Furthermore, analysis of 1,629 citing papers reveals that 81.5% originate from independent researchers, indicating that this methodological approach has been widely adopted and validated by the broader scientific community beyond the researcher's immediate circle.

Showing the 30 most-cited of 80 independent citing papers.

Independent citing papers only; self- and co-author citations excluded. The S2 column carries Semantic Scholar's read of each citation — *Methodology / Result* (the citing work used the method or built on the finding — the "built on / relied upon" pattern the AAO credits), *Influential* (S2's isInfluential signal, Valenzuela et al. 2015), or *Background* (a passing mention).

Contribution 3

Claim — Contribution 3

The researcher established a foundational framework for analyzing landslide-to-debris flow transformation, significantly advancing the understanding of topographic and entrainment effects in catastrophic geological events.

CLAIM: The researcher’s significant contribution centers on elucidating the mechanisms of landslide-to-debris flow transformation, anchored by the seminal 2017 paper on the Wulipo landslide in Dujiangyan City. This core work serves as the foundation for a sustained line of inquiry into the kinematics and dynamics of such geological hazards.

ORIGINALITY: This line of work appears to address the complex interplay between topography and material entrainment during catastrophic slope failures. By progressing from the initial case study to subsequent numerical investigations and kinematic analyses in 2020 and 2022, the researcher systematically expanded the theoretical understanding of how terrain features influence landslide behavior and transformation processes.

SIGNIFICANCE: The impact of this research is evidenced by substantial citation metrics, with the core paper accumulating 86 citations and follow-up works garnering 93 and 102 citations respectively. Furthermore, the high degree of independent uptake, with 81.5% of citing papers originating from researchers outside the scholar’s immediate network, underscores the broad relevance and acceptance of these findings within the global scientific community.

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar's own institution and circle** — the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution's rank as probative on its own.

F. AAO Precedent Considerations

Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out – a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance – numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).
- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

Disclaimer

The AAO decisions referenced here are **non-precedent** – persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition's merits. All analysis must be reviewed by qualified immigration counsel.

G. Citation Evidence Index

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition's exhibit numbers.
