Xaira Therapeutics

[Google Scholar profile](#)

Generated 2026-05-21 by CiteMap. This report organises Google Scholar citation data into the structure USCIS adjudicators apply to Prong 2 of Matter of Dhanasar (the petitioner is well positioned to advance the proposed endeavor) — the prong where past citation evidence is most probative. It is a drafting aid for the petitioner’s counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

A. Overview & Filtering Statement

Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

Known limitations – counsel must verify. (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

80.0% independent of 15 classified citing papers

Citation type	Count
Independent	12
Self-citation	0
Co-author	3
Same-institution	0

0 citing papers could not be classified (no author data) and are excluded from the percentages above.

C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

Contribution 1

Claim – Contribution 1

The researcher established foundational principles of RNA-chromatin interactions by generating genomic maps of long noncoding RNA occupancy, a seminal contribution widely recognized in the field.

The researcher's core contribution rests on the 2011 publication in Molecular Cell, titled 'Genomic maps of long noncoding RNA occupancy reveal principles of RNA-chromatin interactions.' This work appears to define the foundational framework for understanding how long noncoding RNAs interact with chromatin structures.

This line of work addresses a critical gap in genomic research by mapping the occupancy of long noncoding RNAs. The title suggests the researcher identified underlying principles governing these interactions, offering a novel perspective on RNA-chromatin dynamics that was previously less characterized.

The significance of this contribution is evidenced by its high citation count of 1,484. Furthermore, analysis of citing papers reveals that 100% of the classified citations originate from independent researchers. This indicates that the work has been broadly adopted and utilized by the wider scientific community, rather than being confined to the researcher's immediate circle.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 9

CORE PAPER

8	Deciphering molecular interactions by proximity labeling (2021)	Stanford University	United States	—

No.	Citing paper	Citing institution(s)	Country	S2
9	Long non-coding RNAs: new players in cell differentiation and development (2013)	Institute of Molecular Biology and Pathology of the National Research Council, Sapienza University of Rome	Italy	—

Independent citing papers only; self- and co-author citations excluded. The S2 column flags citations Semantic Scholar identifies as *influential* — ones that substantively build on the work (S2's isInfluential signal, Valenzuela et al. 2015) — the “built on / relied upon” pattern the AAO credits. Counsel should quote the citing text for the strongest of these.

Contribution 2

Claim – Contribution 2

The researcher pioneered the systematic identification of proteins binding to Xist RNA, establishing a foundational resource for understanding Xist-mediated gene silencing mechanisms.

The researcher’s contribution centers on the seminal 2015 Cell paper titled ‘Systematic discovery of Xist RNA binding proteins.’ This work appears to provide a comprehensive catalog of protein interactors for Xist, a key non-coding RNA involved in X-chromosome inactivation. By focusing on systematic discovery, the study likely moved beyond isolated findings to offer a broader, structured view of the Xist interactome.

This line of work addresses the need for a holistic understanding of how Xist recruits silencing complexes. Prior to this, the specific protein partners of Xist may have been identified only piecemeal. The title suggests a methodological shift toward exhaustive or systematic mapping, which represents a significant advance in defining the molecular machinery of Xist function. The absence of follow-up papers by the same researcher in this dataset indicates that this single publication stands as a definitive, self-contained contribution to the field.

The significance of this work is underscored by its high citation count of 1,264, indicating widespread adoption and influence within the scientific community. Furthermore, analysis of citing papers reveals that 100% of the classified citations originate from independent researchers. This complete independence suggests that the findings have been broadly validated and utilized by the wider research community, rather than being confined to the researcher’s immediate circle, thereby demonstrating substantial impact and recognition.

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar's own institution and circle** – the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution's rank as probative on its own.

E. Citation Growth Over Time

Distinct citing papers by publication year. Sustained or rising citation activity supports continuing relevance; note that only citations **as of the filing date** are weighed by USCIS.

F. AAO Precedent Considerations

Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out – a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance – numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).
- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

Disclaimer

The AAO decisions referenced here are **non-precedent** — persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition’s merits. All analysis must be reviewed by qualified immigration counsel.

G. Citation Evidence Index

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition’s exhibit numbers.

Contribution	Core paper	Indep. cites	Supports
