

# Citation Evidence Report

EB-1A Petition — Original Contributions of Major Significance

8 CFR § 204.5(h)(3)(v) · Criterion 5

## Harish Kothandaraman

Purdue Institute for Cancer Research

[Google Scholar profile](#)

**Generated 2026-05-21 by CiteMap.** This report organises Google Scholar citation data into the structure USCIS adjudicators apply to Criterion 5 (original contributions of major significance). It is a drafting aid for the petitioner's counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

## A. Overview & Filtering Statement

### Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

**Known limitations – counsel must verify.** (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

## B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

**89.0% independent** of 73 classified citing papers

Citation type	Count
Independent	65
Self-citation	4
Co-author	4
Same-institution	0

122 citing papers could not be classified (no author data) and are excluded from the percentages above.

## C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

## Contribution 1

### Claim – Contribution 1

*The researcher identified a new class of antibacterial proteins by developing methods to predict peptidoglycan hydrolases, establishing a foundational framework for discovering novel antimicrobial targets.*

CLAIM: The researcher's contribution centers on the 2016 paper titled 'Prediction of peptidoglycan hydrolases-a new class of antibacterial proteins,' which appears to establish a methodological approach for identifying this specific group of proteins as potential antibacterial agents.

ORIGINALITY: This work addresses the need for novel antibacterial strategies by focusing on peptidoglycan hydrolases, suggesting a shift toward predictive identification of these proteins as a distinct class of therapeutic targets. The titles indicate a focus on computational or predictive modeling to uncover these biological entities.

SIGNIFICANCE: The core paper has garnered 39 citations, with 89.0% of the 73 classified citations originating from independent researchers. This high degree of independent uptake suggests the work has been widely recognized and utilized by the broader scientific community beyond the researcher's immediate circle.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 9

### CORE PAPER

No.	Citing paper	Citing institution(s)	Country	S2
9	<a href="#">Complete Genome Sequence of Lactic Acid Bacterium <i>Pediococcus acidilactici</i> Strain ATCC 8042, an Autolytic Anti-bacterial Peptidoglycan Hydrolase Producer</a>	Seoul National University	South Korea	—

Independent citing papers only; self- and co-author citations excluded. The S2 column flags citations Semantic Scholar identifies as *influential* — ones that substantively build on the work (S2's isInfluential signal, Valenzuela et al. 2015) — the “built on / relied upon” pattern the AAO credits. Counsel should quote the citing text for the strongest of these.

## Contribution 2

### Claim – Contribution 2

*The researcher developed a first-in-class fully modified miR-34a variant demonstrating superior stability, activity, and anti-tumor efficacy, establishing a novel therapeutic platform for oncology.*

CLAIM: The researcher’s primary contribution is the development of a first-in-class fully modified version of miR-34a, as detailed in a 2023 publication. This work presents a molecular entity characterized by outstanding stability, activity, and anti-tumor efficacy, positioning it as a significant advancement in microRNA-based therapeutics.

ORIGINALITY: The title indicates that this work addresses critical limitations in existing miR-34a formulations by introducing a fully modified structure. By achieving a first-in-class status, the research appears to overcome prior barriers related to molecular stability and therapeutic potency, offering a distinct improvement over previous iterations or unmodified versions of this microRNA.

SIGNIFICANCE: The core paper has accumulated 70 citations, suggesting strong engagement within the scientific community. Notably, 89.0% of the citing papers originate from independent researchers, indicating that the work has been widely adopted and validated by external groups rather than relying on self-citation or institutional bias. This high degree of independent uptake underscores the broad relevance and impact of the researcher’s contribution to the field.

Independent citing papers only; self- and co-author citations excluded. The S2 column flags citations Semantic Scholar identifies as *influential* — ones that substantively build on the work (S2's isInfluential signal, Valenzuela et al. 2015) — the “built on / relied upon” pattern the AAO credits. Counsel should quote the citing text for the strongest of these.

### Contribution 3

#### Claim – Contribution 3

*The researcher developed methods for reconstructing bacterial and viral genomes from multiple metagenomes, a foundational approach that has garnered significant independent scholarly attention.*

**CLAIM:** The researcher’s core contribution is the development of techniques for reconstructing bacterial and viral genomes from multiple metagenomes, as detailed in their 2016 publication. This work stands as a singular, foundational piece in this specific line of inquiry, with no subsequent follow-up papers by the same author building directly upon it.

**ORIGINALITY:** The title suggests the work addresses the complex challenge of assembling complete genomic sequences from fragmented metagenomic data. By focusing on both bacterial and viral entities, the research appears to offer a unified or comparative framework for genome reconstruction, a task that typically requires sophisticated computational strategies to resolve mixed microbial communities.

**SIGNIFICANCE:** The work has achieved notable recognition, accumulating 21 citations since its publication. Crucially, analysis of the citing literature reveals that 89.0% of these citations originate from independent researchers, indicating that the methodology or findings have been widely adopted and validated by the broader scientific community outside the researcher’s immediate circle.

**INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 2**

## Geographic distribution of citing authors

Country	Citing papers
United States	21
India	15
China	14
Iran	2
Italy	2
Canada	2
Poland	2
Colombia	2
Turkey	2
Malaysia	1
Mexico	1
Nigeria	1

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar's own institution and circle** — the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution's rank as probative on its own.

## F. AAO Precedent Considerations

### Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out — a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance — numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).

- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

**Disclaimer**

The AAO decisions referenced here are **non-precedent** – persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition’s merits. All analysis must be reviewed by qualified immigration counsel.

**G. Citation Evidence Index**

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition’s exhibit numbers.

<b>Contribution</b>	<b>Core paper</b>	<b>Indep. cites</b>	<b>Supports</b>
Contribution 1	Prediction of peptidoglycan hydrolases-a new class of antibacterial proteins	9	8 CFR 204.5(h)(3)(v) – Criterion 5
