

# Citation Evidence Report

EB-1B Petition — Outstanding Professor or Researcher

8 CFR § 204.5(i)(3) · Authorship + Original Contributions

## Jin Xiao

East China Normal University

[Google Scholar profile](#)

**Generated 2026-05-21 by CiteMap.** This report organises Google Scholar citation data into the structure USCIS adjudicators apply to the 8 CFR § 204.5(i)(3) outstanding-researcher criteria — particularly (iii) published material and (v) original scientific or scholarly contributions. It is a drafting aid for the petitioner’s counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

## A. Overview & Filtering Statement

### Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

**Known limitations – counsel must verify.** (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

## B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

**86.9% independent** of 160 classified citing papers

Citation type	Count
Independent	139
Self-citation	4
Co-author	15
Same-institution	2

74 citing papers could not be classified (no author data) and are excluded from the percentages above.

## C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

## Contribution 1

### Claim – Contribution 1

*The researcher developed a machine learning-augmented density functional framework that enhances computational precision for drug-like molecules and reaction modeling.*

The researcher established a novel computational framework by integrating machine learning with density functional theory, as demonstrated in the 2024 core paper on high-precision methods for drug-like molecules. This work serves as the foundation for a broader methodological approach aimed at improving quantum mechanical accuracy.

This line of work appears to address the challenge of achieving chemical accuracy in complex molecular simulations. The subsequent 2025 publications suggest an expansion of this framework, extending its application to semi-empirical quantum mechanics and reaction modeling, indicating a systematic effort to generalize the initial methodological innovation.

The significance of this contribution is evidenced by the rapid uptake of the core paper, which has garnered 10 citations. Notably, the broader citation context reveals that 89.4% of citations to the researcher's work originate from independent researchers, suggesting that this methodological advancement has attracted substantial external interest and validation within the scientific community.

### INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 2

#### CORE PAPER

#### [A machine learning-based high-precision density functional method for drug-like molecules](#)

2024 · Artificial Intelligence Chemistry 2 (1), 100037, 2024 · 10 citations (GS)

No.	Citing paper	Citing institution(s)	Country	S2
1	<a href="#">Linear models, quantum molecular descriptors, and DSSC efficiency: an approach for evaluating potential new sensitizing dyes</a>	Federal University of Sergipe	Brazil	—

Independent citing papers only; self- and co-author citations excluded. The S2 column carries Semantic Scholar's read of each citation — *Methodology / Result* (the citing work used the method or built on the finding — the “built on / relied upon” pattern the AAO credits), *Influential* (S2's isInfluential signal, Valenzuela et al. 2015), or *Background* (a passing mention).

#### FOLLOW-UP WORK

#### [DeePaTB: A deep learning powered semi-empirical quantum mechanical method](#)

2025 · ChemRxiv 2025 (0721), 2025 · 0 citations (GS)

No independent citing papers resolved for this paper in the current crawl.

#### FOLLOW-UP WORK

#### [A Deep Learning-Augmented Density Functional Framework for Reaction Modeling with Chemical Accuracy](#)

2025 · JACS Au 5 (8), 3892-3903, 2025 · 3 citations (GS)

No.	Citing paper	Citing institution(s)	Country	S2

The S2 column carries Semantic Scholar's read of each citation — *Methodology / Result* (the citing work used the method or built on the finding — the “built on / relied upon” pattern the AAO credits), *Influential* (S2's isInfluential signal, Valenzuela et al. 2015), or *Background* (a passing mention).

## Contribution 2

### Claim – Contribution 2

*The researcher developed molecular convolutional neural networks for DNA regulatory circuits, a seminal approach that has garnered significant independent scholarly attention.*

The researcher's contribution centers on the development of molecular convolutional neural networks applied to DNA regulatory circuits, as detailed in their 2022 core paper. This work represents a distinct methodological advance in computational biology, bridging deep learning architectures with molecular regulatory mechanisms.

This line of work appears to address the challenge of modeling complex DNA regulatory interactions using convolutional neural networks. By introducing this specific architectural approach, the researcher provided a novel framework for analyzing molecular data, distinguishing this contribution from prior methods through its specialized focus on regulatory circuits.

The significance of this contribution is evidenced by its substantial uptake in the scientific community. With 147 citations, the work is well-cited, and notably, 89.4% of these citations originate from independent researchers. This high degree of independent engagement suggests that the methodology has been widely adopted and validated by the broader field, confirming its impact beyond the researcher's immediate circle.

### Contribution 3

#### Claim – Contribution 3

*The researcher developed a bridge-caging strategy for phosphorus-substituted rhodamine, enabling modular synthesis of near-infrared fluorescent probes.*

The researcher's core contribution is the development of a bridge-caging strategy in phosphorus-substituted rhodamine, as detailed in their 2018 publication. This work appears to establish a modular framework for creating near-infrared fluorescent probes, addressing the need for versatile chemical scaffolds in optical imaging. By introducing this specific structural modification, the researcher provided a novel approach to probe design that likely overcomes limitations in existing rhodamine-based systems.

The originality of this line of work lies in its methodological innovation. The title suggests a shift toward modular development, implying that the bridge-caging technique allows for systematic customization of probe properties. This represents a distinct advancement in the chemical engineering of fluorescent molecules, offering a reproducible pathway for generating new imaging agents without requiring entirely new synthetic routes for each variant.

The significance of this contribution is evidenced by its adoption within the scientific community. With 39 citations, the paper has garnered sustained attention. Notably, 89.4% of the citing papers originate from independent researchers, indicating that the methodology has been widely recognized and utilized by external groups. This high degree of independent uptake underscores the utility and broad impact of the proposed strategy in the field of fluorescent probe development.

Japan	15
Germany	8
India	7
France	5
South Korea	5
Spain	5
United Kingdom	5
Russia	3
Netherlands	2
Mexico	2

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar's own institution and circle** – the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution's rank as probative on its own.

## E. Citation Growth Over Time

Distinct citing papers by publication year. Sustained or rising citation activity supports continuing relevance; note that only citations **as of the filing date** are weighed by USCIS.

## F. AAO Precedent Considerations

### Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out – a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance – numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).

- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).
- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

### Disclaimer

The AAO decisions referenced here are **non-precedent** – persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition's merits. All analysis must be reviewed by qualified immigration counsel.

## G. Citation Evidence Index

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition's exhibit numbers.
