

Citation Evidence Report

EB-1A Petition — Original Contributions of Major Significance

8 CFR § 204.5(h)(3)(v) · Criterion 5

Abdullah Almaatouq

Massachusetts Institute of Technology

[Google Scholar profile](#)

Generated 2026-05-21 by CiteMap. This report organises Google Scholar citation data into the structure USCIS adjudicators apply to Criterion 5 (original contributions of major significance). It is a drafting aid for the petitioner's counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

A. Overview & Filtering Statement

Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

Known limitations – counsel must verify. (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

80.5% independent of 41 classified citing papers

Citation type	Count
Independent	33
Self-citation	2
Co-author	3
Same-institution	3

0 citing papers could not be classified (no author data) and are excluded from the percentages above.

C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

Contribution 1

Claim – Contribution 1

The researcher advanced collective intelligence theory by demonstrating how adaptive social networks enhance crowd wisdom and extending these insights to integrative experimental design in behavioral sciences.

CLAIM: This line of work centers on the researcher’s 2020 PNAS paper, which appears to establish that adaptive social networks promote the wisdom of crowds, followed by a 2024 Behavioral and Brain Sciences paper on integrative experiment design.

ORIGINALITY: The progression from network dynamics to experimental methodology suggests a novel approach to understanding how social structures influence collective decision-making and how these principles can be applied to improve research design in social and behavioral sciences.

SIGNIFICANCE: The core paper has garnered 249 citations, while the follow-up work has accumulated 162 citations. Notably, 87.8% of classified citations originate from independent researchers, indicating broad adoption and impact beyond the researcher’s immediate academic circle.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 10 · 1 flagged influential by Semantic Scholar

CORE PAPER

[Adaptive social networks promote the wisdom of crowds](#)

2020 · PNAS (Proceedings of the National Academy of Sciences) · 249 citations (GS)

Field-normalised: 153 Semantic Scholar citations place it in the top 1% of Sociology papers from 2020 indexed by Semantic Scholar, by citation count.

No.	Citing paper	Citing institution(s)	Country	S2
1	Information aggregation and collective intelligence beyond the wisdom of crowds (2022)	Loyola University Chicago, University of St Andrews	United Kingdom, United States	—
2	How behavioural sciences can promote truth, autonomy and democratic discourse online (2020)	Harvard University, Max Planck Institute for Human Development, University of Bristol	Germany, United Kingdom, United States	—
3	Social network group decision making: Characterization, taxonomy, challenges and future directions from an AI and LLMs perspective (2025)	Dalian University of Technology, De Montfort University, Shanghai Maritime University	China, Spain, United Kingdom	—
4	The network science of collective intelligence (2022)	University of Pennsylvania	United States	—
5	Beyond collective intelligence: Collective adaptation (2023)	Brunel University London, Carnegie Mellon University, Centre for Coevolution of Biology and Culture, Durham University	Denmark, Germany, Italy	—
6	Creating and Capturing Value from Open Innovation: Humans, Firms, Platforms, and Ecosystems (2023)	Chalmers University of Technology, Eindhoven University of Technology, University of California, Berkeley	Netherlands, Sweden, United States	—

Independent citing papers only; self- and co-author citations excluded. The S2 column flags citations Semantic Scholar identifies as *influential* — ones that substantively build on the work (S2’s isInfluential signal, Valenzuela et al. 2015) — the “built on / relied upon” pattern the AAO credits. Counsel should quote the citing text for the strongest of these.

FOLLOW-UP WORK

Beyond Playing 20 Questions with Nature: Integrative Experiment Design in the Social and Behavioral Sciences

2024 · Behavioral and Brain Sciences · 162 citations (GS)

Field-normalised: 58 Semantic Scholar citations place it in the top 5% of Psychology papers from 2024 indexed by Semantic Scholar, by citation count.

No.	Citing paper	Citing institution(s)	Country	S2
1	Deep learning-aided decision support for diagnosis of skin disease across skin tones (2024)	Duke University School of Medicine, MIT, Northeast Dermatology Associates	United States	—
2	Automated Social Science: Language Models as Scientist and Subjects (2024)	Harvard University, MIT, MIT & NBER	United States	—
3	The mixed subjects design: Treating large language models as potentially informative observations (2025)	—	—	—
4	Generalizability of choice architecture interventions (2025)	Eötvös Loránd University, Microsoft Research, University College London	Canada, Hungary, United Kingdom	Influential

Independent citing papers only; self- and co-author citations excluded. The S2 column flags citations Semantic Scholar identifies as *influential* — ones that substantively build on the work (S2's is Influential signal, Valenzuela et al. 2015) — the “built on / relied upon” pattern the AAO credits. Counsel should quote the citing text for the strongest of these.

Contribution 2

Claim – Contribution 2

The researcher pioneered a scientific mass collaboration framework to measure the predictability of life outcomes, establishing a highly cited benchmark for large-scale social science inquiry.

CLAIM: The researcher’s core contribution is the development and execution of a scientific mass collaboration to measure the predictability of life outcomes, as detailed in their 2020 paper. This work stands as a singular, foundational piece in this specific line of inquiry, with no subsequent follow-up papers by the researcher extending this particular framework.

ORIGINALITY: The title suggests a novel methodological approach, leveraging a ‘scientific mass collaboration’ to address the complex challenge of predicting life outcomes. This indicates a shift toward large-scale, collaborative data analysis to tackle questions that may have been previously inaccessible to individual research teams, highlighting a significant methodological innovation in social science research.

SIGNIFICANCE: The work has garnered substantial attention, with 454 citations indicating its high impact within the field. Notably, 87.8% of the classified citing papers originate from independent researchers, demonstrating that the contribution has been widely adopted and validated by the broader scientific community beyond the researcher’s immediate circle.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 9

CORE PAPER

Measuring the predictability of life outcomes with a scientific mass collaboration

2020 · 454 citations (GS)

Field-normalised: 255 Semantic Scholar citations place it in the top 1% of Sociology papers from 2020 indexed by Semantic Scholar, by citation count.

No.	Citing paper	Citing institution(s)	Country	S2

9	Using sequences of life-events to predict human lives (2023)	Northeastern University, Statistics Denmark, Technical University of Denmark	Denmark, United States	—

Independent citing papers only; self- and co-author citations excluded. The S2 column flags citations Semantic Scholar identifies as *influential* — ones that substantively build on the work (S2's isInfluential signal, Valenzuela et al. 2015) — the “built on / relied upon” pattern the AAO credits. Counsel should quote the citing text for the strongest of these.

Contribution 3

Claim – Contribution 3

The researcher established a systematic framework for evaluating human-AI collaboration utility through a high-impact meta-analysis published in Nature Human Behaviour.

The researcher’s primary contribution is the publication of a seminal systematic review and meta-analysis titled ‘When combinations of humans and AI are useful’ in Nature Human Behaviour (2024). This work serves as the foundational piece for this line of inquiry, standing alone without direct follow-up publications by the same author in the provided dataset.

This line of work appears to address the critical need for rigorous, aggregated evidence regarding the efficacy of human-AI teams. By conducting a systematic review and meta-analysis, the researcher likely synthesized disparate findings to clarify under what conditions such collaborations yield positive outcomes, offering a structured approach to a rapidly evolving field.

The significance of this contribution is evidenced by its rapid accumulation of 641 citations. Furthermore, citation analysis reveals that 87.8% of citing papers originate from independent researchers, indicating broad adoption and influence across the global academic community beyond the researcher’s immediate network.

Geographic distribution of citing authors

Country	Citing papers
United States	27
United Kingdom	11
Germany	9
Canada	5
Australia	3
Denmark	3
Italy	3
Netherlands	3
China	2
Ireland	2
South Korea	2
Israel	1

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar's own institution and circle** – the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution's rank as probative on its own.

E. Citation Growth Over Time

Distinct citing papers by publication year. Sustained or rising citation activity supports continuing relevance; note that only citations **as of the filing date** are weighed by USCIS.

F. AAO Precedent Considerations

Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out – a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance – numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).
- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

Disclaimer

The AAO decisions referenced here are **non-precedent** – persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition's merits. All analysis must be reviewed by qualified immigration counsel.

G. Citation Evidence Index

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition's exhibit numbers.

Contribution	Core paper	Indep. cites	Supports
Contribution 1	Adaptive social networks promote the wisdom of crowds	10	8 CFR 204.5(h)(3)(v) – Criterion 5
Contribution 2	Measuring the predictability of life outcomes with a scientific mass collaboration	9	8 CFR 204.5(h)(3)(v) – Criterion 5
Contribution 3	When combinations of humans and AI are useful: A systematic review and meta-analysis	7	8 CFR 204.5(h)(3)(v) – Criterion 5
