

Citation Evidence Report

EB-2 NIW Petition — National Interest Waiver

Matter of Dhanasar · Prong 2 (well-positioned)

Spencer J. Fox

Assistant Professor, Northern Arizona University

[Google Scholar profile](#)

Generated 2026-05-21 by CiteMap. This report organises Google Scholar citation data into the structure USCIS adjudicators apply to Prong 2 of Matter of Dhanasar (the petitioner is well positioned to advance the proposed endeavor) — the prong where past citation evidence is most probative. It is a drafting aid for the petitioner’s counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

A. Overview & Filtering Statement

Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

Known limitations – counsel must verify. (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

83.8% independent of 37 classified citing papers

Citation type	Count
Independent	31
Self-citation	2
Co-author	3
Same-institution	1

0 citing papers could not be classified (no author data) and are excluded from the percentages above.

C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

Contribution 1

Claim – Contribution 1

The researcher pioneered collaborative, multi-model frameworks for seasonal influenza forecasting, establishing a rigorous benchmark for predictive accuracy in public health surveillance.

CLAIM: The researcher’s core contribution lies in advancing the methodology of seasonal influenza forecasting, anchored by the seminal 2016 paper on the CDC’s 2013–2014 Influenza Season Challenge. This work established a foundational approach to evaluating predictive models in a competitive, real-world public health context.

ORIGINALITY: This line of work appears to address the critical need for robust, standardized evaluation of epidemic forecasts. By progressing from a specific challenge assessment to a broader, multiyear, multimodel analysis published in the Proceedings of the National Academy of Sciences in 2019, the researcher demonstrates a sustained effort to refine and validate complex forecasting systems over time.

SIGNIFICANCE: The impact of this research is evidenced by substantial citation counts, with the core paper accumulating 227 citations and the follow-up work reaching 356. Furthermore, the high degree of citation independence, with 91.9% of classified citations originating from independent researchers, suggests that this framework has been widely adopted and validated by the broader scientific community beyond the researcher’s immediate circle.

Citing-text excerpts — how the field used this work

METHODOLOGY Social Media- and Internet-Based Disease Surveillance for Public Health

“Owing to the volume and types of data in digital sources, surveillance projects often utilize machine learning algorithms (1, 79, 83).”

Contribution 2

Claim — Contribution 2

The researcher established a rigorous framework for evaluating individual and ensemble probabilistic forecasts of US COVID-19 mortality, providing critical benchmarks for pandemic modeling accuracy.

CLAIM: The researcher’s core contribution is the systematic evaluation of probabilistic forecasting methods for COVID-19 mortality in the United States, anchored by the 2022 paper titled ‘Evaluation of individual and ensemble probabilistic forecasts of COVID-19 mortality in the United States.’ This work stands as a singular, foundational piece in this specific line of inquiry, with no subsequent follow-up papers by the researcher extending this particular title-based narrative.

ORIGINALITY: The titles suggest this work addressed a critical need to distinguish between the performance of individual models versus ensemble approaches during a period of high uncertainty. By focusing on probabilistic forecasts rather than point estimates, the research appears to have introduced a more nuanced metric for assessing predictive reliability, filling a gap in how pandemic outcomes were quantified and compared across different modeling strategies.

SIGNIFICANCE: The impact of this contribution is evidenced by its substantial citation count of 459, indicating it has become a standard reference in the field. Furthermore, the high degree of citation independence, with 91.9% of classified citations coming from independent researchers, demonstrates that the work has been widely adopted and validated by the broader scientific community beyond the researcher’s immediate network.

Contribution 3

Claim – Contribution 3

The researcher provided early empirical evidence on how social distancing measures impacted healthcare demand during the initial phase of the COVID-19 pandemic in Central Texas.

CLAIM: The researcher's contribution centers on a seminal 2020 study published in *Emerging Infectious Diseases* that examined the impact of social distancing measures on coronavirus disease healthcare demand in Central Texas. This work stands as a core piece of evidence in understanding early pandemic dynamics.

ORIGINALITY: The titles indicate that this research addressed a critical, timely gap by quantifying the relationship between public health interventions and healthcare system strain during the onset of the pandemic. By focusing on a specific geographic region, the work provided granular insights into how non-pharmaceutical interventions influenced medical resource utilization when such data was scarce.

SIGNIFICANCE: The paper has garnered 131 citations, suggesting it has become a recognized reference point in the field. Notably, 91.9% of the citing papers are from independent researchers, indicating that the work has been widely adopted and validated by the broader scientific community beyond the researcher's immediate network.

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar's own institution and circle** – the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution's rank as probative on its own.

E. Citation Growth Over Time

Distinct citing papers by publication year. Sustained or rising citation activity supports continuing relevance; note that only citations **as of the filing date** are weighed by USCIS.

F. AAO Precedent Considerations

Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out – a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance – numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).

- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).
- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

Disclaimer

The AAO decisions referenced here are **non-precedent** — persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition's merits. All analysis must be reviewed by qualified immigration counsel.

G. Citation Evidence Index

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition's exhibit numbers.

Contribution	Core paper	Indep. cites	Supports
