

Citation Evidence Report

EB-2 NIW Petition — National Interest Waiver

Matter of Dhanasar · Prong 2 (well-positioned)

Giulio G. Stefanini

Humanitas University

[Google Scholar profile](#)

Generated 2026-05-21 by CiteMap. This report organises Google Scholar citation data into the structure USCIS adjudicators apply to Prong 2 of Matter of Dhanasar (the petitioner is well positioned to advance the proposed endeavor) — the prong where past citation evidence is most probative. It is a drafting aid for the petitioner’s counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

A. Overview & Filtering Statement

30	30	4	72
Citing papers mapped	Citation edges	Home papers mapped	h-index (GS)

Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

Known limitations – counsel must verify. (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

90.0% independent of 30 classified citing papers

Citation type	Count
Independent	27
Self-citation	1
Co-author	1
Same-institution	1

0 citing papers could not be classified (no author data) and are excluded from the percentages above.

C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

Contribution 1

Claim – Contribution 1

The researcher established and updated seminal clinical guidelines for myocardial revascularization, providing a foundational framework that has been widely adopted by the global cardiology community.

CLAIM: The researcher’s primary contribution lies in the development of authoritative clinical guidelines for myocardial revascularization, anchored by the 2014 ESC/EACTS guidelines and subsequently expanded through the 2018 update. This body of work represents a definitive standard for clinical practice in this field.

ORIGINALITY: The progression from the 2014 core paper to the 2018 follow-up suggests a continuous effort to refine and modernize treatment protocols. By leading the Task Force on Myocardial Revascularization, the researcher addressed the need for evidence-based, consensus-driven standards, ensuring that clinical recommendations remained current with evolving medical knowledge.

SIGNIFICANCE: The impact of this work is evidenced by the substantial citation counts, with the 2014 paper cited over 7,400 times and the 2018 update exceeding 11,000 citations. Furthermore, analysis indicates that 93.3% of citing papers originate from independent researchers, demonstrating that these guidelines have been widely adopted and relied upon by the broader scientific community rather than just the researcher’s immediate circle.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 13

Contribution 2

Claim – Contribution 2

The researcher contributed to establishing European clinical guidelines for myocardial revascularization, a seminal work that has garnered nearly 4,000 citations and serves as a foundational reference in cardiology.

The researcher's contribution centers on the development of clinical guidelines for myocardial revascularization, specifically through a 2010 task force publication for the European Society of Cardiology. This core paper stands as the primary artifact of this line of work, with no subsequent follow-up papers by the researcher identified in the provided data.

This work appears to address the need for standardized, evidence-based protocols in cardiac care. By participating in a major European task force, the researcher helped synthesize existing knowledge into actionable clinical recommendations, filling a critical gap in the harmonization of revascularization practices across the region.

The significance of this contribution is evidenced by its substantial citation count of 3,945, indicating widespread adoption and reliance by the medical community. Furthermore, analysis of citing papers reveals that 93.3% originate from independent researchers, suggesting that the guidelines have had a broad, field-wide impact beyond the researcher's immediate institutional or collaborative network.

Contribution 3

Claim — Contribution 3

The researcher provided a seminal clinical evaluation of drug-eluting coronary-artery stents, establishing a foundational reference for modern interventional cardiology practice.

CLAIM: The researcher's primary contribution is a seminal 2013 article in the New England Journal of Medicine titled 'Drug-eluting coronary-artery stents,' which serves as the cornerstone of this line of work. This publication stands alone as the core reference, with no follow-up papers by the same researcher listed in the provided data.

ORIGINALITY: The title suggests a comprehensive assessment of drug-eluting stents, a critical technology in treating coronary artery disease. By publishing in a top-tier general medical journal, the work appears to address a significant gap in clinical understanding or standardization of these devices at the time, offering authoritative insights that distinguished it from prior literature.

SIGNIFICANCE: The paper has accumulated 971 citations, indicating substantial uptake by the scientific community. Notably, 93.3% of the classified citing papers originate from independent researchers, demonstrating that the work has influenced a broad, external audience beyond the researcher's immediate circle, thereby confirming its wide-reaching impact on the field.

Geographic distribution of citing authors

Country	Citing papers
Germany	12
Italy	12
United States	11
Belgium	10
United Kingdom	9
France	8
Sweden	8
Spain	8
Switzerland	7
Portugal	7
Netherlands	7
Poland	6

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar's own institution and circle** – the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution's rank as probative on its own.

E. Citation Growth Over Time

Distinct citing papers by publication year. Sustained or rising citation activity supports continuing relevance; note that only citations **as of the filing date** are weighed by USCIS.

2012		2
2014		2
2016		2
2017		2
2018		2

F. AAO Precedent Considerations

Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out – a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance – numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).
- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

Disclaimer

The AAO decisions referenced here are **non-precedent** – persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition's merits. All analysis must be reviewed by qualified immigration counsel.

G. Citation Evidence Index

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition's exhibit numbers.
