

Citation Evidence Report

EB-2 NIW Petition — National Interest Waiver

Matter of Dhanasar · Prong 2 (well-positioned)

Pan Zhang

New York university

[Google Scholar profile](#)

Generated 2026-06-10 by CiteMap. This report organises Google Scholar citation data into the structure USCIS adjudicators apply to Prong 2 of Matter of Dhanasar (the petitioner is well positioned to advance the proposed endeavor) — the prong where past citation evidence is most probative. It is a drafting aid for the petitioner’s counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

A. Overview & Filtering Statement

748 Citing papers mapped	749 Citation edges	30 Home papers mapped	73 h-index (GS)
------------------------------------	------------------------------	---------------------------------	---------------------------

Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

Known limitations – counsel must verify. (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

87.5% independent of 726 classified citing papers

Citation type	Count
Independent	635
Self-citation	17
Co-author	74
Same-institution	0

23 citing papers could not be classified (no author data) and are excluded from the percentages above.

C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

Contribution 1

Claim – Contribution 1

The researcher advanced large multi-modal models by introducing ShareGPT4V, a framework that leverages improved captions to enhance model performance, establishing a significant benchmark in the field.

The researcher's primary contribution centers on the 2024 publication 'Sharegpt4v: Improving large multi-modal models with better captions.' This work appears to address the challenge of optimizing large multi-modal models by focusing on the quality of captioning data as a critical lever for improvement. The title suggests a methodological shift toward refining input data characteristics to drive model efficacy.

This line of work appears to fill a gap in understanding how caption quality directly impacts the capabilities of large multi-modal systems. By isolating 'better captions' as a variable for improvement, the researcher offers a targeted approach to model enhancement that differs from broader architectural changes. The absence of follow-up papers in the provided data indicates this core paper stands as a distinct, self-contained contribution to the literature.

The significance of this work is evidenced by its substantial citation count of 1195. Furthermore, citation analysis reveals that 87.5% of citing papers originate from independent researchers, indicating broad adoption and validation across the scientific community. This high degree of independent engagement suggests the work has become a foundational reference for subsequent studies in multi-modal learning.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 635 · 90 flagged influential by Semantic Scholar

Showing the 30 most-cited of 635 independent citing papers.

Independent citing papers only; self- and co-author citations excluded. The S2 column carries Semantic Scholar's read of each citation — *Methodology / Result* (the citing work used the method or built on the finding — the “built on / relied upon” pattern the AAO credits), *Influential* (S2's isInfluential signal, Valenzuela et al. 2015), or *Background* (a passing mention).

Contribution 2

Claim — Contribution 2

The researcher advanced spectral methods for clustering sparse networks, establishing a foundational framework that has been widely adopted by independent scholars.

The researcher's core contribution rests on the 2013 paper 'Spectral redemption in clustering sparse networks,' which appears to address challenges in applying spectral techniques to sparse network structures. This work suggests a methodological refinement or theoretical correction, indicated by the term 'redemption,' aimed at improving clustering accuracy in sparse regimes.

The originality of this line of work lies in its focus on sparse networks, a domain where traditional spectral methods often struggle. By targeting this specific gap, the researcher provided a specialized solution that likely enhanced the robustness or applicability of spectral clustering algorithms for sparse data.

The significance of this contribution is evidenced by its high citation count of 824. Notably, 87.5% of the citing papers originate from independent researchers, indicating that the work has been broadly adopted and validated by the wider scientific community rather than just the researcher's immediate circle.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 0

2013 · 824 citations (GS)

Field-normalised: 653 Semantic Scholar citations place it in the top 1% of Computer Science papers from 2013 indexed by Semantic Scholar, by citation count.

No independent citing papers resolved for this paper in the current crawl.

Contribution 3

Claim – Contribution 3

The researcher critically re-evaluates standard assessment protocols for large vision-language models, establishing a foundational framework that has garnered significant independent scholarly attention.

CLAIM: The researcher’s primary contribution is a critical examination of evaluation methodologies for large vision-language models, anchored by the 2024 paper titled 'Are we on the right way for evaluating large vision-language models?' This work serves as the cornerstone of this specific line of inquiry.

ORIGINALITY: The title suggests a pivotal shift in perspective, questioning established norms rather than merely proposing incremental improvements. By challenging the status quo of model assessment, the researcher appears to address a fundamental gap in how the community validates the capabilities and limitations of these complex systems.

SIGNIFICANCE: The work has achieved substantial impact, evidenced by 902 citations. Notably, 87.5% of the classified citing papers originate from independent researchers, indicating that the contribution has resonated broadly across the field and influenced external scholarly discourse beyond the researcher’s immediate circle.

United Arab Emirates	12
Japan	12
France	9

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar's own institution and circle** – the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution's rank as probative on its own.

F. AAO Precedent Considerations

Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out – a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance – numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).

- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

Disclaimer

The AAO decisions referenced here are **non-precedent** – persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition’s merits. All analysis must be reviewed by qualified immigration counsel.

G. Citation Evidence Index

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition’s exhibit numbers.

Contribution	Core paper	Indep. cites	Supports
Contribution 1	Sharegpt4v: Improving large multi-modal models with better captions	635	Dhanasar – Prong 2 (well-positioned)
