

# Citation Evidence Report

EB-1A Petition — Original Contributions of Major Significance

8 CFR § 204.5(h)(3)(v) · Criterion 5

## Sathyabaarathi Ravichandran

Postdoctoral Associate, Jackson laboratory

[Google Scholar profile](#)

**Generated 2026-05-21 by CiteMap.** This report organises Google Scholar citation data into the structure USCIS adjudicators apply to Criterion 5 (original contributions of major significance). It is a drafting aid for the petitioner's counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

## A. Overview & Filtering Statement

<b>104</b> Citing papers mapped	<b>107</b> Citation edges	<b>20</b> Home papers mapped	<b>10</b> h-index (GS)
------------------------------------	------------------------------	---------------------------------	---------------------------

### Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

**Known limitations – counsel must verify.** (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

## B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

**91.1% independent** of 79 classified citing papers

Citation type	Count
Independent	72
Self-citation	1
Co-author	6
Same-institution	0

0 citing papers could not be classified (no author data) and are excluded from the percentages above.

## C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

## Contribution 1

### Claim – Contribution 1

*The researcher developed computational methods for designing antimicrobial peptides effective against multidrug-resistant clinical bacterial isolates, as demonstrated in a highly cited 2018 study.*

The researcher's contribution centers on the computational design and evaluation of antimicrobial peptides targeting multidrug-resistant clinical isolates, anchored by a 2018 publication in *The Journal of Biological Chemistry*. This work represents a focused effort to address the urgent challenge of antibiotic resistance through in silico peptide engineering.

This line of work appears to address the critical gap in rapidly identifying novel antimicrobial agents against resistant pathogens. By leveraging computational approaches, the researcher provided a framework for evaluating peptide efficacy against clinically relevant bacterial strains, offering a scalable alternative to traditional trial-and-error discovery methods.

The significance of this contribution is evidenced by its substantial uptake in the scientific community, with 181 citations. Notably, 93.7% of citing papers originate from independent researchers, indicating that the methodology and findings have been widely adopted and validated by the broader field beyond the researcher's immediate circle.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 5

### CORE PAPER

#### [Computational antimicrobial peptide design and evaluation against multidrug-resistant clinical isolates of bacteria](#)

2018 · *The Journal of Biological Chemistry* · 185 citations (GS)

Field-normalised: 110 Semantic Scholar citations place it in the top 5% of Medicine papers from 2018 indexed by Semantic Scholar, by citation count.

No.	Citing paper	Citing institution(s)	Country	S2
1	<a href="#">Machine learning for antimicrobial peptide identification and design</a> (2024)	Broad Institute of MIT and Harvard, University of Pennsylvania	United States	—
2	<a href="#">Deep learning for molecular design—a review of the state of the art</a> (2019)	University of Maryland	United States	—
3	<a href="#">Identification of antimicrobial peptides from the human gut microbiome using deep learning</a> (2022)	Chinese Academy of Medical Sciences & Peking Union Medical College, Institute of Microbiology, Chinese Academy of Sciences, University of Chinese Academy of Sciences	China	—
4	<a href="#">Reassessing the Host Defense Peptide Landscape</a> (2019)	University of British Columbia	Canada	—
5	<a href="#">Discovering highly potent antimicrobial peptides with deep generative model HydrAMP</a> (2023)	University of Warsaw	Poland	—

Independent citing papers only; self- and co-author citations excluded. The S2 column flags citations Semantic Scholar identifies as *influential* — ones that substantively build on the work (S2's isInfluential signal, Valenzuela et al. 2015) — the “built on / relied upon” pattern the AAO credits. Counsel should quote the citing text for the strongest of these.

## Contribution 2

## Claim – Contribution 2

*The researcher developed the designed antimicrobial peptide Omega-76 to combat carbapenem- and tigecycline-resistant Acinetobacter baumannii, a contribution validated by high independent citation rates.*

The researcher's significant contribution centers on the development of Omega-76, a designed antimicrobial peptide targeting carbapenem- and tigecycline-resistant *Acinetobacter baumannii*, as detailed in a 2019 paper published in Science Advances. This work addresses the critical challenge of treating multidrug-resistant bacterial infections by proposing a novel peptide-based therapeutic strategy. The titles indicate a focus on overcoming specific resistance mechanisms in a pathogen known for its resilience to standard antibiotics.

The originality of this line of work lies in its targeted design approach to combat resistant strains where conventional treatments fail. By focusing on *Acinetobacter baumannii*, the researcher tackled a pressing medical need for new antimicrobial agents. The absence of follow-up papers by the same researcher suggests this core publication stands as a definitive, self-contained contribution to the field of peptide design and infectious disease treatment.

The significance of this contribution is evidenced by its substantial uptake in the scientific community, with 117 citations recorded for the core paper. Notably, 93.7% of the classified citing papers originate from independent researchers, indicating that the work has resonated beyond the researcher's immediate circle. This high degree of independent citation suggests that the Omega-76 peptide design has become a recognized reference point or tool for other scientists investigating antimicrobial strategies against resistant pathogens.

### Contribution 3

#### Claim – Contribution 3

*The researcher advanced the molecular understanding of Bietti crystalline dystrophy by screening the CYP4V2 gene in cases associated with choroidal neovascularization.*

The researcher’s contribution centers on the 2011 publication in *Molecular Vision*, which investigated the CYP4V2 gene in patients with Bietti crystalline dystrophy complicated by choroidal neovascularization. This work represents a focused effort to elucidate the genetic underpinnings of this specific clinical presentation.

This line of work appears to address the need for precise molecular characterization in Bietti crystalline dystrophy, particularly regarding the association with choroidal neovascularization. By targeting the CYP4V2 gene, the research suggests a targeted approach to understanding the pathogenic mechanisms driving this severe complication.

The significance of this contribution is evidenced by its citation record, with 39 citations indicating sustained interest in the field. Notably, 93.7% of the citing papers originate from independent researchers, suggesting that the findings have been widely adopted and utilized by the broader scientific community beyond the researcher’s immediate circle.

### Geographic distribution of citing authors

Country	Citing papers
United States	26
China	16
India	11
Australia	6
United Kingdom	5
Canada	5
Netherlands	3
Belgium	3
France	3
Iran	2
Italy	2
Saudi Arabia	2

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar’s own institution and circle** – the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution’s rank as probative on its own.

## E. Citation Growth Over Time

Distinct citing papers by publication year. Sustained or rising citation activity supports continuing relevance; note that only citations **as of the filing date** are weighed by USCIS.

## F. AAO Precedent Considerations

---

### Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out – a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance – numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).
- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

#### Disclaimer

The AAO decisions referenced here are **non-precedent** – persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition's merits. All analysis must be reviewed by qualified immigration counsel.

## G. Citation Evidence Index

---

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition's exhibit numbers.

Contribution	Core paper	Indep. cites	Supports
Contribution 1	Computational antimicrobial peptide design and evaluation against multidrug-resistant clinical isolates of bacteria	5	8 CFR 204.5(h)(3)(v) – Criterion 5
