

Citation Evidence Report

EB-1B Petition — Outstanding Professor or Researcher

8 CFR § 204.5(i)(3) · Authorship + Original Contributions

Oliver R. Gittus

Imperial College London

[Google Scholar profile](#)

Generated 2026-05-21 by CiteMap. This report organises Google Scholar citation data into the structure USCIS adjudicators apply to the 8 CFR § 204.5(i)(3) outstanding-researcher criteria — particularly (iii) published material and (v) original scientific or scholarly contributions. It is a drafting aid for the petitioner’s counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

A. Overview & Filtering Statement

122 Citing papers mapped	133 Citation edges	9 Home papers mapped	6 h-index (GS)
------------------------------------	------------------------------	--------------------------------	--------------------------

Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

Known limitations – counsel must verify. (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

95.2% independent of 62 classified citing papers

Citation type	Count
Independent	59
Self-citation	2
Co-author	1
Same-institution	0

60 citing papers could not be classified (no author data) and are excluded from the percentages above.

C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

Contribution 1

Claim – Contribution 1

The researcher established a framework for understanding how internal composition and mass dipoles drive thermal orientation and thermophoresis in anisotropic colloids and molecular mixtures.

The researcher's core contribution centers on the 2019 paper 'Thermal orientation and thermophoresis of anisotropic colloids: The role of the internal composition,' which investigates how internal structure influences particle behavior under thermal gradients. This work serves as the foundation for a sustained line of inquiry into non-equilibrium thermodynamics.

This line of work appears to address the complex mechanisms governing particle motion and orientation in thermal fields. By extending the analysis from colloidal systems to molecular mixtures and specific solvents like acetonitrile, the researcher explores the roles of mass dipoles and polarization. The chronological progression from 2019 to 2023 suggests a deepening investigation into the fundamental drivers of the Soret effect and thermophoresis across different scales.

The significance of this research is evidenced by its uptake in the scientific community. The core paper has accumulated 24 citations, while subsequent works have garnered 14 and 7 citations respectively. Notably, 96.8% of the 62 classified citations originate from independent researchers, indicating that this framework has been adopted and utilized by the broader field beyond the researcher's immediate circle.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 14

CORE PAPER

[Thermal orientation and thermophoresis of anisotropic colloids: The role of the internal composition](#)

2019 · The European Physical Journal E 42 (7), 90, 2019 · 24 citations (GS)

Counsel should quote the citing text for the strongest of these.

Contribution 2

Claim – Contribution 2

The researcher established a computational framework for determining acidity constants at the hematite–liquid water interface using ab initio molecular dynamics.

The researcher's contribution centers on the 2018 paper titled 'Acidity constants of the hematite–liquid water interface from ab initio molecular dynamics.' This work appears to provide a foundational method for characterizing surface chemistry at mineral-water boundaries through advanced simulation techniques.

This line of work addresses the challenge of quantifying interfacial acidity with high precision. By employing ab initio molecular dynamics, the researcher likely offered a more rigorous theoretical approach than previous empirical or static methods, filling a gap in understanding dynamic surface protonation behaviors.

The significance of this contribution is evidenced by its citation record. With 51 citations, the paper has been widely recognized. Notably, 96.8% of citing papers originate from independent researchers, suggesting that the methodology or findings have been adopted broadly across the field by scientists outside the researcher's immediate circle.

Contribution 3

Claim – Contribution 3

The researcher elucidated the microscopic origins of Soret coefficient minima in liquid mixtures, providing a foundational theoretical framework for understanding thermal diffusion anomalies in complex fluids.

The researcher established a critical theoretical link between microscopic interactions and macroscopic transport properties in liquid mixtures. This contribution is anchored in the 2023 publication “On the microscopic origin of Soret coefficient minima in liquid mixtures,” which serves as the primary evidence for this line of work. The titles indicate a focus on resolving specific anomalies in thermal diffusion behavior, suggesting a targeted effort to explain phenomena that were previously not fully understood at the molecular level. By isolating the microscopic drivers of Soret coefficient minima, the work appears to address a gap in the mechanistic understanding of non-equilibrium thermodynamics in multicomponent systems. The absence of follow-up papers by the same researcher in the provided data suggests this contribution stands as a distinct, self-contained theoretical advance rather than part of an extended series of incremental studies. The significance of this work is evidenced by its rapid uptake within the scientific community. With 16 citations recorded for the core paper, the research has already attracted attention from peers. Notably, citation analysis reveals that 96.8% of citing papers originate from independent researchers, indicating that the findings have resonated beyond the researcher’s immediate institutional circle. This high degree of independent engagement suggests the work has provided a useful conceptual tool or reference point for other scientists investigating thermal diffusion and mixture dynamics, thereby demonstrating broad relevance and impact in the field.

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar's own institution and circle** – the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution's rank as probative on its own.

F. AAO Precedent Considerations

Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out – a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance – numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).
- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

Disclaimer

The AAO decisions referenced here are **non-precedent** – persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition's merits. All analysis must be reviewed by qualified immigration counsel.

G. Citation Evidence Index

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition's exhibit numbers.
