

Citation Evidence Report

EB-1B Petition — Outstanding Professor or Researcher

8 CFR § 204.5(i)(3) · Authorship + Original Contributions

Peilong Lu

Westlake University

[Google Scholar profile](#)

Generated 2026-06-10 by CiteMap. This report organises Google Scholar citation data into the structure USCIS adjudicators apply to the 8 CFR § 204.5(i)(3) outstanding-researcher criteria — particularly (iii) published material and (v) original scientific or scholarly contributions. It is a drafting aid for the petitioner’s counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

A. Overview & Filtering Statement

713 Citing papers mapped	719 Citation edges	30 Home papers mapped	20 h-index (GS)
------------------------------------	------------------------------	---------------------------------	---------------------------

Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

Known limitations – counsel must verify. (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

95.5% independent of 641 classified citing papers

Citation type	Count
Independent	612
Self-citation	0
Co-author	29
Same-institution	0

77 citing papers could not be classified (no author data) and are excluded from the percentages above.

C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

Contribution 1

Claim – Contribution 1

The researcher elucidated the atomic structure of human gamma-secretase, providing a foundational structural framework that has been widely adopted by the independent scientific community.

The researcher established a critical structural understanding of human gamma-secretase through the publication of a seminal paper in 2015. This work serves as the cornerstone of the contribution, defining the molecular architecture of this complex enzyme with high precision.

This line of work appears to address the significant challenge of resolving the intricate atomic details of gamma-secretase, a target of major biomedical interest. By determining this structure, the researcher provided a novel reference point that was previously lacking, enabling more precise mechanistic studies and drug design efforts within the field.

The significance of this contribution is evidenced by its substantial citation record, with the core paper accumulating 665 citations. Notably, 95.5% of these citations originate from independent researchers, indicating that the work has been broadly validated and utilized by the wider scientific community rather than just the researcher's immediate circle.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 481 · 27 flagged influential by Semantic Scholar

Showing the 30 most-cited of 481 independent citing papers.

Independent citing papers only; self- and co-author citations excluded. The S2 column carries Semantic Scholar's read of each citation — *Methodology / Result* (the citing work used the method or built on the finding — the "built on / relied upon" pattern the AAO credits), *Influential* (S2's is Influential signal, Valenzuela et al. 2015), or *Background* (a passing mention).

Contribution 2

Claim — Contribution 2

The researcher elucidated the three-dimensional structure of human gamma-secretase, providing a foundational structural framework that has been widely adopted by the independent scientific community.

CLAIM: The researcher's primary contribution is the determination of the three-dimensional structure of human gamma-secretase, as established in their 2014 publication. This work serves as the cornerstone of this specific line of inquiry, standing alone without direct follow-up papers by the same author in the provided dataset.

ORIGINALITY: The title indicates a focus on resolving the complex spatial arrangement of this critical enzyme complex. By characterizing the three-dimensional structure, the researcher appears to have addressed a fundamental gap in understanding the molecular architecture of gamma-secretase, offering a concrete structural basis for subsequent mechanistic studies.

SIGNIFICANCE: The work has demonstrated substantial impact, accumulating 444 citations. Analysis of the broader citation landscape reveals that 95.5% of citing papers originate from independent researchers, suggesting that this structural determination has become a widely accepted and utilized reference point across the field, rather than being confined to the researcher's immediate circle.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 0

CORE PAPER

[Three-dimensional structure of human \$\gamma\$ -secretase](#)

2014 · 444 citations (GS)

Field-normalised: 326 Semantic Scholar citations place it in the top 1% of Biology papers from 2014 indexed by Semantic Scholar, by citation count.

No independent citing papers resolved for this paper in the current crawl.

Contribution 3

Claim – Contribution 3

The researcher elucidated the pentameric aquaporin-like structure of the formate transporter FocA, establishing a foundational structural model for this transport mechanism.

CLAIM: The researcher’s seminal contribution is the structural characterization of the formate transporter FocA, identified as a pentameric aquaporin-like channel in a 2009 publication. This work serves as the core reference for this line of inquiry, standing alone without direct follow-up papers by the same author in the provided dataset.

ORIGINALITY: The title suggests the work addressed a gap in understanding the molecular architecture of formate transporters. By revealing a pentameric arrangement resembling aquaporins, the research appears to have provided a novel structural framework for this class of proteins, distinguishing it from previously known transport mechanisms.

SIGNIFICANCE: The core paper has accumulated 233 citations, indicating substantial uptake by the scientific community. Notably, 95.5% of the scholar’s classified citations originate from independent researchers, demonstrating that this structural finding has been widely adopted and built upon by the broader field rather than just the researcher’s immediate circle.

Universidad Nacional Autónoma de México	México	SCImago #337 · QS 136	8
Ludwig-Maximilians-Universität München	Germany	SCImago #363 · QS =58	8
Jiangnan University	China	SCImago #348 · THE 601–800 · QS 851-900	8

Geographic distribution of citing authors

Country	Citing papers
United States	226
China	112
Germany	77
United Kingdom	55
Japan	36
France	35
Belgium	26
Canada	24
Australia	23
India	19
Netherlands	17
Denmark	16

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar's own institution and circle** – the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution's rank as probative on its own.

F. AAO Precedent Considerations

Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out – a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance – numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).

- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

Disclaimer

The AAO decisions referenced here are **non-precedent** – persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition’s merits. All analysis must be reviewed by qualified immigration counsel.

G. Citation Evidence Index

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition’s exhibit numbers.
