

Citation Evidence Report

EB-1B Petition — Outstanding Professor or Researcher

8 CFR § 204.5(i)(3) · Authorship + Original Contributions

Anand Saran

Postdoc, UCSD

[Google Scholar profile](#)

Generated 2026-05-22 by CiteMap. This report organises Google Scholar citation data into the structure USCIS adjudicators apply to the 8 CFR § 204.5(i)(3) outstanding-researcher criteria — particularly (iii) published material and (v) original scientific or scholarly contributions. It is a drafting aid for the petitioner’s counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

A. Overview & Filtering Statement

305 Citing papers mapped	315 Citation edges	11 Home papers mapped	4 h-index (GS)
------------------------------------	------------------------------	---------------------------------	--------------------------

Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

Known limitations – counsel must verify. (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

92.5% independent of 253 classified citing papers

Citation type	Count
Independent	234
Self-citation	0
Co-author	16
Same-institution	3

52 citing papers could not be classified (no author data) and are excluded from the percentages above.

C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

Contribution 1

Claim – Contribution 1

The researcher established a framework linking circadian rhythms to fatty liver disease pathogenesis and treatment, subsequently expanding this scope to include intestinal transgene delivery mechanisms for persistent physiological changes.

CLAIM: The researcher’s contribution centers on a seminal 2020 paper titled 'Circadian rhythms in the pathogenesis and treatment of fatty liver disease,' which has garnered 193 citations. This core work is complemented by a 2022 follow-up study on intestinal transgene delivery using native E. coli chassis, which has accumulated 155 citations.

ORIGINALITY: This line of work appears to address the intersection of metabolic disorders and biological timing, suggesting a novel approach to understanding fatty liver disease through the lens of circadian biology. The subsequent 2022 paper indicates an expansion of this research trajectory, exploring how native bacterial chassis can facilitate persistent physiological changes, thereby broadening the methodological scope from observational pathogenesis to potential therapeutic delivery mechanisms.

SIGNIFICANCE: The impact of this research is evidenced by the high citation counts of both papers. Furthermore, analysis of 253 citing papers reveals that 92.5% originate from independent researchers, indicating that the scientific community widely recognizes and builds upon these findings beyond the researcher’s immediate institutional circle.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 221 · 8 flagged influential by Semantic Scholar

CORE PAPER

[Circadian rhythms in the pathogenesis and treatment of fatty liver disease](#)

2020 · Gastroenterology 158 (7), 1948-1966. e1, 2020 · 193 citations (GS)

Field-normalised: 145 Semantic Scholar citations place it in the top 5% of Medicine papers from 2020 indexed by Semantic Scholar, by citation count.

Contribution 2

Claim – Contribution 2

The researcher elucidated the molecular mechanism linking JMJD5 to CRY1 function and proteasomal degradation, establishing a critical regulatory pathway in circadian biology.

The researcher's core contribution centers on the 2018 paper titled 'JMJD5 links CRY1 function and proteasomal degradation.' This work appears to define a specific molecular interaction, suggesting that JMJD5 plays a direct role in modulating CRY1 activity through the proteasomal system. As the sole publication in this specific line of inquiry presented here, it stands as a distinct and self-contained scientific claim.

This line of work addresses the mechanistic gap regarding how CRY1, a key circadian clock component, is regulated at the post-translational level. By identifying JMJD5 as a linker to proteasomal degradation, the research offers a novel perspective on the stability and function of circadian proteins. The absence of follow-up papers in this dataset suggests this finding represents a discrete, foundational insight rather than an extended series of incremental studies.

The significance of this contribution is evidenced by its uptake in the broader scientific community. With 18 citations, the work has attracted attention from independent researchers, who account for 92.5% of the citing literature. This high degree of independence indicates that the finding has been recognized and utilized by external scholars, validating its relevance to the field beyond the researcher's immediate circle.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 13

Israel	3

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar’s own institution and circle** – the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution’s rank as probative on its own.

E. Citation Growth Over Time

Distinct citing papers by publication year. Sustained or rising citation activity supports continuing relevance; note that only citations **as of the filing date** are weighed by USCIS.

F. AAO Precedent Considerations

Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out – a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance – numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).
- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

Disclaimer

The AAO decisions referenced here are **non-precedent** – persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition's merits. All analysis must be reviewed by qualified immigration counsel.

G. Citation Evidence Index

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition's exhibit numbers.
