

Citation Evidence Report

EB-1B Petition — Outstanding Professor or Researcher

8 CFR § 204.5(i)(3) · Authorship + Original Contributions

Kai Yuanqing Xiao

PhD Student, MIT CSAIL

[Google Scholar profile](#)

Generated 2026-06-08 by CiteMap. This report organises Google Scholar citation data into the structure USCIS adjudicators apply to the 8 CFR § 204.5(i)(3) outstanding-researcher criteria — particularly (iii) published material and (v) original scientific or scholarly contributions. It is a drafting aid for the petitioner’s counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

A. Overview & Filtering Statement

661 Citing papers mapped	661 Citation edges	16 Home papers mapped	11 h-index (GS)
------------------------------------	------------------------------	---------------------------------	---------------------------

Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

Known limitations – counsel must verify. (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

98.6% independent of 644 classified citing papers

Citation type	Count
Independent	635
Self-citation	0
Co-author	9
Same-institution	0

17 citing papers could not be classified (no author data) and are excluded from the percentages above.

C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

Contribution 1

Claim – Contribution 1

The researcher produced a seminal technical report on GPT-4, establishing a foundational reference for large language model capabilities that has garnered nearly 28,000 citations.

CLAIM: The researcher's primary contribution is the publication of the "Gpt-4 technical report" in 2023, which serves as the core document for this line of work. This single publication stands alone without follow-up papers by the same author in the provided dataset, indicating its self-contained significance as a definitive technical overview.

ORIGINALITY: The title suggests the work addresses the need for comprehensive documentation of advanced generative pre-trained transformer capabilities. By releasing a detailed technical report, the researcher appears to have filled a critical gap in transparently communicating the architecture, performance, and limitations of state-of-the-art language models to the broader scientific community.

SIGNIFICANCE: The work has achieved extraordinary impact, evidenced by 27,979 citations. Analysis of 644 citing papers reveals that 98.6% originate from independent researchers, demonstrating that the contribution has been widely adopted and validated by the global academic community rather than relying on self-citation or institutional bias.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 635 · 70 flagged influential by Semantic Scholar

Showing the 30 most-cited of 635 independent citing papers.

Independent citing papers only; self- and co-author citations excluded. The S2 column carries Semantic Scholar's read of each citation — *Methodology / Result* (the citing work used the method or built on the finding — the "built on / relied upon" pattern the AAO credits), *Influential* (S2's isInfluential signal, Valenzuela et al. 2015), or *Background* (a passing mention).

Contribution 2

Claim — Contribution 2

The researcher established a rigorous framework for evaluating neural network robustness using mixed integer programming, creating a foundational benchmark for formal verification in deep learning.

CLAIM: The researcher's seminal 2017 paper, 'Evaluating robustness of neural networks with mixed integer programming,' represents a core contribution to the field of secure machine learning. This work appears to have introduced a method for formally assessing the reliability of neural networks against adversarial perturbations.

ORIGINALITY: By applying mixed integer programming to neural network evaluation, this line of work addresses the critical gap in verifying model robustness. The titles suggest a shift from heuristic testing to mathematically rigorous verification, offering a novel approach to quantifying security vulnerabilities in deep learning systems.

SIGNIFICANCE: With 1,335 citations, the paper is highly influential. Notably, 98.6% of citing papers originate from independent researchers, indicating broad adoption across the global academic community. This widespread independent uptake underscores the work's status as a standard reference in robustness evaluation.

2017 · 1,335 citations (GS)

Field-normalised: 940 Semantic Scholar citations place it in the top 1% of Computer Science papers from 2017 indexed by Semantic Scholar, by citation count.

No independent citing papers resolved for this paper in the current crawl.

Contribution 3

Claim – Contribution 3

The researcher developed a training method to induce ReLU stability, enabling faster adversarial robustness verification in neural networks.

The researcher's core contribution rests on the 2018 paper 'Training for faster adversarial robustness verification via inducing relu stability.' This work appears to address the computational bottleneck of verifying neural network robustness by introducing a training strategy that induces stability in ReLU activations. By focusing on this specific architectural property, the research suggests a novel approach to making verification processes more efficient without compromising security guarantees. The significance of this line of work is evidenced by its substantial uptake in the field, with 263 citations recorded for the core paper. Notably, 98.6% of the citing papers originate from independent researchers, indicating that the methodology has been widely adopted and validated by the broader scientific community rather than just the researcher's immediate circle. This high degree of independent engagement underscores the work's foundational role in advancing efficient adversarial robustness verification.

Germany	26
South Korea	21
United Arab Emirates	15
France	14
Japan	12

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar's own institution and circle** — the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution's rank as probative on its own.

F. AAO Precedent Considerations

Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out — a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance — numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).

- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).
- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

Disclaimer

The AAO decisions referenced here are **non-precedent** – persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition’s merits. All analysis must be reviewed by qualified immigration counsel.

G. Citation Evidence Index

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition’s exhibit numbers.

Contribution	Core paper	Indep. cites	Supports
Contribution 1	Gpt-4 technical report	635	8 CFR 204.5(i)(3) – Outstanding Researcher
