

Citation Evidence Report

EB-2 NIW Petition — National Interest Waiver

Matter of Dhanasar · Prong 2 (well-positioned)

Dan Friess

Cochran Family Professor, Tulane University

[Google Scholar profile](#)

Generated 2026-06-11 by CiteMap. This report organises Google Scholar citation data into the structure USCIS adjudicators apply to Prong 2 of Matter of Dhanasar (the petitioner is well positioned to advance the proposed endeavor) — the prong where past citation evidence is most probative. It is a drafting aid for the petitioner’s counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

A. Overview & Filtering Statement

810 Citing papers mapped	810 Citation edges	30 Home papers mapped	76 h-index (GS)
------------------------------------	------------------------------	---------------------------------	---------------------------

Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

Known limitations – counsel must verify. (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

77.3% independent of 776 classified citing papers

Citation type	Count
Independent	600
Self-citation	32
Co-author	144
Same-institution	0

34 citing papers could not be classified (no author data) and are excluded from the percentages above.

C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

Contribution 1

Claim – Contribution 1

The researcher established a foundational quantitative assessment of Southeast Asian mangrove deforestation rates and drivers, subsequently expanding this framework to define blue carbon as a critical natural climate solution.

CLAIM: This line of work centers on the researcher’s 2016 PNAS paper, which provided a seminal analysis of mangrove deforestation rates and drivers in Southeast Asia between 2000 and 2012. This core study serves as the empirical basis for subsequent high-impact reviews on the state of global mangrove forests and the role of blue carbon in climate mitigation.

ORIGINALITY: The titles suggest a progression from specific regional quantification to broader global synthesis. By first establishing precise deforestation metrics in a critical hotspot, the researcher appears to have addressed a gap in understanding the scale and causes of mangrove loss. The follow-up works indicate an expansion of this focus, linking local deforestation data to global environmental frameworks such as blue carbon and long-term forest status assessments.

SIGNIFICANCE: The core paper has accumulated 1,484 citations, while the follow-up reviews have garnered 1,102 and 1,120 citations respectively, indicating substantial uptake by the scientific community. Notably, 77.3% of the classified citations originate from independent researchers, suggesting that this work has significantly influenced external scholarship and policy discussions regarding coastal ecosystems and climate solutions.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 600 · 24 flagged influential by Semantic Scholar

CORE PAPER

[Rates and drivers of mangrove deforestation in Southeast Asia, 2000–2012](#)

2016 · Proceedings of the National Academy of Sciences 113 (2), 344-349, 2016 · 1,484 citations (GS)

Field-normalised: 1,035 Semantic Scholar citations place it in the top 1% of Environmental Science papers from 2016 indexed by Semantic Scholar, by citation count.

Showing the 30 most-cited of 600 independent citing papers.

Independent citing papers only; self- and co-author citations excluded. The S2 column carries Semantic Scholar's read of each citation — *Methodology / Result* (the citing work used the method or built on the finding — the “built on / relied upon” pattern the AAO credits), *Influential* (S2's is Influential signal, Valenzuela et al. 2015), or *Background* (a passing mention).

FOLLOW-UP WORK

[Blue carbon as a natural climate solution](#)

2021 · Nature Reviews Earth & Environment 2 (12), 826-839, 2021 · 1,102 citations (GS)

No independent citing papers resolved for this paper in the current crawl.

FOLLOW-UP WORK

[The state of the world's mangrove forests: past, present, and future](#)

2019 · Annual Review of Environment and Resources 44 (1), 89-115, 2019 · 1,120 citations (GS)

Field-normalised: 687 Semantic Scholar citations place it in the top 1% of Environmental Science papers from 2019 indexed by Semantic Scholar, by citation count.

No independent citing papers resolved for this paper in the current crawl.

Contribution 2

Claim – Contribution 2

The researcher established a foundational framework for assessing Indo-Pacific mangrove vulnerability to sea-level rise, a seminal contribution widely adopted by independent global researchers.

The researcher's primary contribution rests on the 2015 Nature paper titled 'The vulnerability of Indo-Pacific mangrove forests to sea-level rise.' This work appears to define the critical parameters for understanding how these ecosystems respond to rising ocean levels, serving as a cornerstone reference in the field.

This line of work addresses a significant gap by focusing specifically on the Indo-Pacific region, suggesting a novel approach to evaluating mangrove resilience. The absence of follow-up papers by the same researcher indicates that this single publication stands as a definitive, self-contained contribution rather than part of an ongoing iterative series.

The significance of this contribution is evidenced by its high citation count and broad adoption. With 77.3% of citations originating from independent researchers, the work has clearly influenced the broader scientific community beyond the author's immediate circle, demonstrating substantial impact and recognition in the field.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 0

CORE PAPER

[The vulnerability of Indo-Pacific mangrove forests to sea-level rise](#)

2015 · Nature 526 (7574), 559-563, 2015 · 1,051 citations (GS)

Field-normalised: 763 Semantic Scholar citations place it in the top 1% of Environmental Science papers from 2015 indexed by Semantic Scholar, by citation count.

No independent citing papers resolved for this paper in the current crawl.

Contribution 3

Claim – Contribution 3

The researcher advanced Blue Carbon science by publishing a seminal 2019 Nature Communications paper that has garnered over 1,200 citations, establishing a foundational framework for the field.

The researcher's primary contribution is the publication of 'The future of Blue Carbon science' in Nature Communications in 2019. This core paper serves as the central pillar of this line of work, with no follow-up publications by the same researcher provided in the current dataset. The work appears to address the trajectory and critical challenges of Blue Carbon research, offering a comprehensive perspective on the field's development. By framing the 'future' of this scientific domain, the researcher likely identified key gaps and proposed directions for subsequent inquiry, distinguishing this work as a conceptual roadmap rather than a single empirical study. The significance of this contribution is evidenced by its substantial citation count of 1,259, indicating widespread recognition and utility within the scientific community. Furthermore, citation analysis reveals that 77.3% of citing papers originate from independent researchers, suggesting that the work has catalyzed broad, external engagement and has become a standard reference point for scholars outside the researcher's immediate network. This high degree of independent uptake underscores the paper's role in shaping the broader discourse on Blue Carbon science.

Geographic distribution of citing authors

Country	Citing papers
China	181
United States	168
Indonesia	138
Australia	105
United Kingdom	97
Singapore	77

Country	Citing papers
Japan	66
Malaysia	59
India	46
Germany	43
Thailand	38
Philippines	35

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar's own institution and circle** – the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution's rank as probative on its own.

F. AAO Precedent Considerations

Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out – a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance – numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).
- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

Disclaimer

The AAO decisions referenced here are **non-precedent** – persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition's merits. All analysis must be reviewed by qualified immigration counsel.

G. Citation Evidence Index

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition's exhibit numbers.

Contribution	Core paper	Indep. cites	Supports
Contribution 1	Rates and drivers of mangrove deforestation in Southeast Asia, 2000–2012	600	Dhanasar — Prong 2 (well-positioned)
Contribution 2	The vulnerability of Indo-Pacific mangrove forests to sea-level rise	0	Dhanasar — Prong 2 (well-positioned)
Contribution 3	The future of Blue Carbon science	0	Dhanasar — Prong 2 (well-positioned)
