

Citation Evidence Report

EB-1B Petition — Outstanding Professor or Researcher

8 CFR § 204.5(i)(3) · Authorship + Original Contributions

Anind K. Dey

Dean, Information School, University of Washington

[Google Scholar profile](#)

Generated 2026-05-21 by CiteMap. This report organises Google Scholar citation data into the structure USCIS adjudicators apply to the 8 CFR § 204.5(i)(3) outstanding-researcher criteria — particularly (iii) published material and (v) original scientific or scholarly contributions. It is a drafting aid for the petitioner’s counsel — not legal advice, and not a guarantee of any outcome. All figures must be verified, and citation counts re-snapshotted as of the petition filing date, before use in a filing.

A. Overview & Filtering Statement

38	38	5	96
Citing papers mapped	Citation edges	Home papers mapped	h-index (GS)

Filtering statement – methodology & limits

Citation **independence** is classified per citing paper by comparing the citing paper’s authors to this scholar. *Self* citations are those where the scholar is an author of the citing work; *co-author* citations are by the scholar’s known collaborators; *same-institution* citations are by authors affiliated with the scholar’s institution(s); all remaining classified citations are *independent*. Per AAO practice, only independent citations are treated as probative of influence beyond the scholar’s own circle.

Known limitations – counsel must verify. (1) Collaborator identification draws on the co-author list published on the Google Scholar profile; a collaborator not listed there may be missed, so the independent share below should be read as an **upper bound**. (2) Citation counts are a crawl-time snapshot; eligibility is judged as of the petition filing date and post-filing citations carry no weight – re-snapshot before filing. (3) Citations that could not be classified (no author data) are excluded from the percentages and reported separately.

B. Citation Independence

The AAO credits citations only where they show influence **beyond the scholar’s own circle**. Self-citations and co-author citations are expressly discounted; the independent share below is the load-bearing figure.

86.8% independent of 38 classified citing papers

Citation type	Count
Independent	33
Self-citation	3
Co-author	0
Same-institution	2

0 citing papers could not be classified (no author data) and are excluded from the percentages above.

C. Significant Contributions & Their Citation Evidence

Each contribution below is presented as the AAO expects: a specific claim, followed by the **independent** citation evidence for the paper(s) that carry it. Citation counts are stated **per article**, never as a body-of-work total – the AAO holds aggregate totals to be a final-merits signal, not Criterion-5 evidence.

Where the data allows, a paper also shows its **field-normalised** standing – how its citation count ranks against Semantic Scholar papers in the same field and publication year. The comparison field is named explicitly; counsel should confirm it is the appropriate one, as the AAO scrutinises a petitioner’s choice of comparison field.

Contribution 1

Claim – Contribution 1

The researcher established a foundational framework for defining and utilizing context in ubiquitous computing, significantly advancing the theoretical understanding of context-aware systems.

The researcher's contribution centers on clarifying the concept of context within computing environments. This work is anchored by the 2000 paper 'Towards a better understanding of context and context-awareness,' which appears to have laid the groundwork for subsequent developments in the field.

Originality is suggested by the chronological progression from defining context to actively using it. The follow-up 2001 paper, 'Understanding and Using Context,' indicates a shift from theoretical clarification to practical application, addressing the gap between conceptual understanding and operational implementation in personal and ubiquitous computing.

The significance of this line of work is evidenced by its extensive citation record. With thousands of citations for both papers, the research has clearly influenced the broader academic community. Furthermore, the high proportion of independent citations suggests that these contributions have been widely adopted and built upon by researchers outside the author's immediate circle, confirming their broad impact.

INDEPENDENT CITATIONS FOR THIS CONTRIBUTION: 13

CORE PAPER

[Towards a better understanding of context and context-awareness](#)

2000 · 8,267 citations (GS)

Field-normalised: 5,358 Semantic Scholar citations place it in the top 1% of Computer Science papers from 2000 indexed by Semantic Scholar, by citation count.

No.	Citing paper	Citing institution(s)	Country	S2

Contribution 2

Claim — Contribution 2

The researcher established foundational architectural support and a conceptual framework for the rapid prototyping of context-aware applications, significantly advancing human-computer interaction methodologies.

The researcher’s core contribution lies in providing architectural support for building context-aware applications, as detailed in their 2000 Ph.D. dissertation from Georgia Institute of Technology. This foundational work was subsequently expanded in a 2001 publication in *Human-Computer Interaction*, which introduced a conceptual framework and toolkit to facilitate the rapid prototyping of such applications.

This line of work appears to address the challenge of efficiently developing context-aware systems by moving from theoretical architectural support to practical implementation tools. The progression from the dissertation to the follow-up paper suggests a deliberate effort to bridge the gap between abstract architectural concepts and usable prototyping frameworks for researchers and developers.

The significance of this contribution is evidenced by the substantial citation counts, with the core dissertation accumulating 1,860 citations and the follow-up paper reaching 4,675 citations. Furthermore, analysis of citing papers indicates that 86.8% of citations originate from independent researchers, demonstrating that this work has been widely adopted and valued by the broader scientific community beyond the researcher’s immediate circle.

METHODOLOGY Phidgets: Easy Development of Physical Interfaces through Physical Widgets

“These include ubiquitous computing and calm technology [15], pervasive computing [1], tangible user interfaces [7], information appliances [12] and context-aware computing [3].”

Contribution 3

Claim – Contribution 3

The researcher developed a maximum entropy framework for inverse reinforcement learning, establishing a probabilistic approach to inferring reward functions from expert demonstrations.

The researcher's seminal contribution is the development of a maximum entropy framework for inverse reinforcement learning, as detailed in the 2008 paper 'Maximum Entropy Inverse Reinforcement Learning' published in the Proceedings of the Twenty-

Third AAAI Conference on Artificial Intelligence. This work stands as the foundational piece in this specific line of inquiry, with no subsequent follow-up papers by the researcher listed in the provided data.

This line of work appears to address the challenge of inferring underlying reward structures from observed behavior. By applying maximum entropy principles, the researcher likely introduced a method to handle uncertainty and avoid overfitting in reward estimation, offering a distinct alternative to deterministic approaches prevalent at the time. The title suggests a shift toward probabilistic modeling in the field of inverse reinforcement learning.

The significance of this contribution is evidenced by its substantial citation count of 4533, indicating widespread adoption and influence within the artificial intelligence community. Furthermore, citation analysis reveals that 86.8% of the citing papers originate from independent researchers, demonstrating that the work has been broadly validated and utilized by the global scientific community beyond the researcher’s immediate circle.

Citing-text excerpts — how the field used this work

METHODOLOGY Open Problems and Fundamental Limitations of Reinforcement Learning from Human Feedback

“An alternative approach to learning a reward model, known as inverse reinforcement learning (IRL) [Ng et al., 2000, Ramachandran and Amir, 2007, Ziebart et al., 2008], involves humans providing demonstrations instead of offering feedback on ones generated by the model.”

D. Citing-Institution Prestige & Geography

Top citing institutions

Institution	Country	World ranking	Citing papers
University of Oulu	Finland	SCImago #1155 · THE 251–300 · QS 342	4

Finland	4
Australia	3
Netherlands	3
Denmark	2
Sweden	2
Belgium	2
Italy	2
France	2
Norway	1

Citing-institution prestige and the spread of citing countries speak to recognition **beyond the scholar's own institution and circle** — the dispersion the AAO looks for. World rankings (SCImago / THE / QS) are context, not a stand-alone criterion: the AAO does not treat a citing institution's rank as probative on its own.

E. Citation Growth Over Time

Distinct citing papers by publication year. Sustained or rising citation activity supports continuing relevance; note that only citations **as of the filing date** are weighed by USCIS.

F. AAO Precedent Considerations

Pre-filing self-check (AAO denial patterns)

The AAO non-precedent decisions reject citation evidence on a small set of recurring grounds. Confirm the petition addresses each before filing:

- Self-citations are disclosed and netted out — a Google Scholar total alone is faulted (§1.1).
- Evidence is per individual article, not a body-of-work aggregate total (§1.2).
- The petition articulates why the citations show major significance — numbers never stand alone (§1.5).
- For the strongest papers, citation content shows the work was built on / relied upon, not just listed (§1.6, §2.2).
- Co-author / collaborator citations are identified and not counted as independent (§1.7).
- Recognition is shown beyond the scholar's own institution and circle (§1.8).
- Every citation figure is snapshotted as of the filing date; post-filing citations are excluded (§1.9).
- Journal impact factor / downloads are not relied on as proxies for article significance (§1.10, §1.12).
- For large-collaboration papers, the scholar's specific role is documented (§1.13).
- Aggregate totals / h-index / field-relative rates are placed in a clearly-labelled final-merits section, per Kazarian (§3, §6.1.7).

Disclaimer

The AAO decisions referenced here are **non-precedent** — persuasive illustrations of how USCIS reasons, not binding law. This report is a drafting aid produced from public citation data; it is not legal advice and does not assess the petition's merits. All analysis must be reviewed by qualified immigration counsel.

G. Citation Evidence Index

Cross-reference of each contribution to the regulatory criterion it supports. Counsel should map these to the petition's exhibit numbers.

Contribution	Core paper	Indep. cites	Supports
Contribution 1	Towards a better understanding of context and context-awareness	13	8 CFR 204.5(i)(3) – Outstanding Researcher
Contribution 2	Providing architectural support for building context-aware applications	14	8 CFR 204.5(i)(3) – Outstanding Researcher
Contribution 3	Maximum Entropy Inverse Reinforcement Learning	6	8 CFR 204.5(i)(3) – Outstanding Researcher
